FIGURE 5-278. V_{APP}, V_{REF} AND ACTUAL LANDING DISTANCE FROM 50 FT; FLAPS - 39° (Sheet 1 of 15)

NOTE

1. Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.
2. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10 kt overspeed.
3. If required: increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA.
4. See Actual Landing Distance Wind Components Correction; Flaps - 39°, Figure 5-279.

NOTE

1. Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.
2. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10 kt overspeed.
3. If required: increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA.
4. See Actual Landing Distance Wind Components Correction; Flaps - 39°, Figure 5-279.

FIGURE 5-289. ABNORMAL V_{APP}, V_{REF} AND ACTUAL LANDING DISTANCE FROM 50 FT; FLAPS - 20° (Sheet 1 of 15)

NOTE

1. Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.
2. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10 kt overspeed.
3. If required: increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA.
4. See Actual Abnormal Landing Distance Wind Components Correction; Flaps - 20°, Figure 5-290.

FIGURE 5-289. ABNORMAL V_{APP}, V_{REF} AND ACTUAL LANDING DISTANCE FROM 50 FT; FLAPS - 20° (Sheet 3 of 15)

NOTE

1. Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.
2. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10 kt overspeed.
3. If required: increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA.
4. See Actual Abnormal Landing Distance Wind Components Correction; Flaps - 20°, Figure 5-290.

FIGURE 5-293. ABNORMAL V_{APP}, V_{REF} AND ACTUAL LANDING DISTANCE FROM 50 FT; FLAPS - 10° (Sheet 1 of 15)

NOTE

1. Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.
2. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10 kt overspeed.
3. If required: increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA.
4. See Actual Abnormal Landing Distance Wind Components Correction; Flaps - 10°, Figure 5-294.

FIGURE 5-297. ABNORMAL V_{APP}, V_{REF} AND ACTUAL LANDING DISTANCE FROM 50 FT; FLAPS - 0° (Sheet 12 of 15)

NOTE

1. Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.
2. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10 kt overspeed.
3. If required: increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA.
4. See Actual Abnormal Landing Distance Wind Components Correction; Flaps - 0°, Figure 5-298.

FOREWORD

In accordance with Civil Aviation Authority procedures, detailed weight and balance data in this section are not subject to CAAI approval. Loading instructions in this section, however, have been approved by CAAI as satisfying their requirements for instructions on loading this airplane within approved limits of weight and center-of-gravity and on maintaining loading within such limits.

INTRODUCTION

GENERAL

This is the weight and balance manual for the Gulfstream G280. aircraft. It is prepared in accordance with FAR 25.1583(c). A copy of this manual with the appropriate aircraft weight and balance data inserted will be delivered to the operator with each aircraft. Gulfstream Aerospace Corporation (GAC) will provide weight and balance data for custom furnishings and avionics for the individual aircraft to which this particular copy of the weight and balance manual applies.

When the aircraft is ready for delivery to the operator, GAC will determine the aircraft weight (by actual weighing) and record the basic weight and cg. The loading of the aircraft then becomes the operator's responsibility. It is important that the basic weight and cg be revised when any changes are made to the aircraft.

AIRCRAFT LOADING DATA

The main purpose of this manual is to ensure that the aircraft is operated within the allowable weight and center of gravity limits. This is achieved by observing the weight limitations listed in ALLOWABLE OPERATING WEIGHTS (LB), page VI-7 and using the procedure in ZERO FUEL WEIGHT CG LIMIT, page VI-11 to ensure that the zero fuel weight is within the ZFW center of gravity envelope. A complete worked example of the procedure is provided.

DEFINITIONS, page VI-4, TYPICAL WEIGHT SUMMARY, page VI-8, ZERO FUEL WEIGHT ENVELOPE, page VI-9 and ZERO FUEL WEIGHT RESTRICTED ZONE FUEL QUANTITY, page VI-10 provide additional data including typical weight summaries and definitions of terms used in this report.

FLOOR LOADING LIMITATIONS, page VI-15 points out the possibility of the aircraft tipping back under certain abnormal conditions and shows how to avoid the situation.

LANDING GEAR EXTENSION EFFECTS ON AIRCRAFT CG, page VI-16 and STATIC BALANCE TOLERANCES ON CONTROL SURFACES, page VI-17 respectively give data about the effect of landing gear position on aircraft cg and control surface mass balancing.

FUEL CG TABLE (GROUND STATIC ATTITUDE -1.7°), page VI-18 contains a fuel cg chart. % MAC VS. ARM (IN), page VI-20 illustrates a table for converting aircraft cg expressed as fuselage stations to percentages of MAC and vice versa.

AIRCRAFT WEIGHING PROCEDURES

AIRCRAFT WEIGHING PROCEDURES, page VI-22, contains PREPARATION FOR WEIGHING, LEVELING THE AIRCRAFT and MEASUREMENTS. It deals with the leveling and weighing of the aircraft. (A sample loading calculation is available). In addition to these procedures, scale manufacturer's instructions must be complied with.

EQUIPMENT LISTS

List of standard equipment and list of completion and operational items are furnished by GAC.

RECORD OF AIRCRAFT WEIGHT AND BALANCE

AIRCRAFT WEIGHING PROCEDURES, page VI-22 contains forms as follows:
Form A - WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-25.
Form C - FORM C EMPTY WEIGHT AND CG CHANGE LOG, page VI-27.
Form D - FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-28. These forms are used to compute and record weights and centers of gravity, from actual weights to ramp gross weight procedure. Form B is used by the manufacturer for delivery flights to a specific outfitting location. A complete record of this form will be entered into the aircraft's actual weight records. Forms A, C, and D will be used throughout the operational life of the aircraft.
It is recommended that all weight and balance records be preserved, clearly marking those that have been superseded.

AIRCRAFT LOADING DATA

DEFINITIONS

UNITS

All weights in this manual are expressed in pounds. All lengths in this manual are expressed in inches.

ALLOWABLE OPERATING WEIGHTS

The weight limitations of the aircraft at various flight stages. (see ALLOWABLE OPERATING WEIGHTS (LB), page VI-7 for values).

MTW

Maximum Taxi Weight (called also Maximum Ramp Weight) - Maximum weight approved for ground maneuver. It includes weight of start, taxi and run-up fuel.

MTOW

Maximum Takeoff Weight - Maximum weight approved for the start of the takeoff run.

MLW

Maximum Landing Weight - Maximum weight approved for the landing touchdown.

MZFW

Maximum Zero Fuel Weight - The maximum authorized weight of an aircraft without fuel.

MFW

Minimum Flight Weight - The Minimum authorized flight weight of an aircraft. It may be changed as a function of the relevant center of gravity.

BEW

Basic Empty Weight - Empty weight and crew.

(Continued)

BOW

Basic Operating Weight (Called also OWE - Operational Weight Empty) - The empty weight of the aircraft plus the weight of the required crew, their baggage and other standard items such as meals and potable water.

ARM

Called also Y coordinate, measured in inches, uses the location of components and the complete aircraft for longitudinal center of gravity (cg).

MAC

Mean Aerodynamic Chord - A wing reference chord. There is an option to present the longitudinal cg in non dimensional units (an alternative system to arm) of %MAC. This unit system is in use for Weight / cg envelope.

MAC = 112.92; LE MAC from datum = 405.71

The conversion formula between the 2 coordinate systems is:

$$\%MAC = \frac{\text{Arm (in)} - 405.71}{112.92} \times 100$$

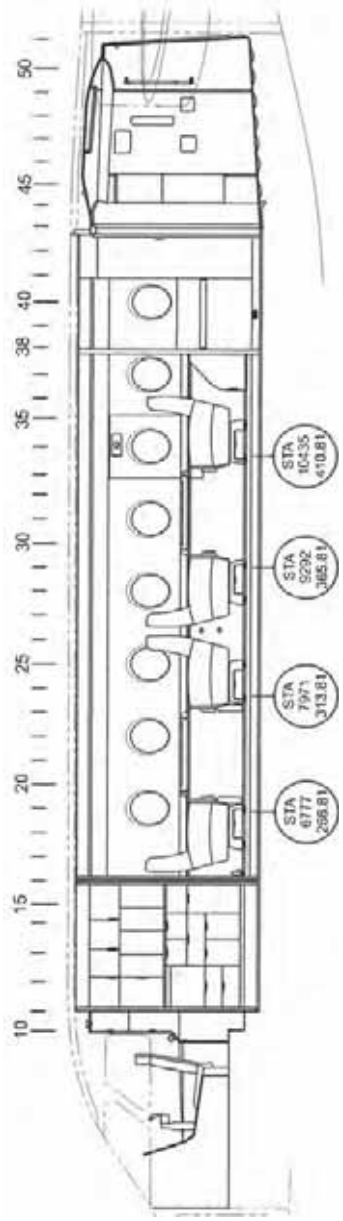
UNUSABLE FUEL

Combined of unusable undrainable fuel and unusable drainable fuel. these quantities are part of the basic weight.

Fuel	Weight (LB)
Undrainable	36
Drainable	87
Total Unusable	123

Other aircraft weight terms can be understood by referencing TYPICAL WEIGHT SUMMARY, page VI-8.

AIRCRAFT FUSELAGE STATIONS



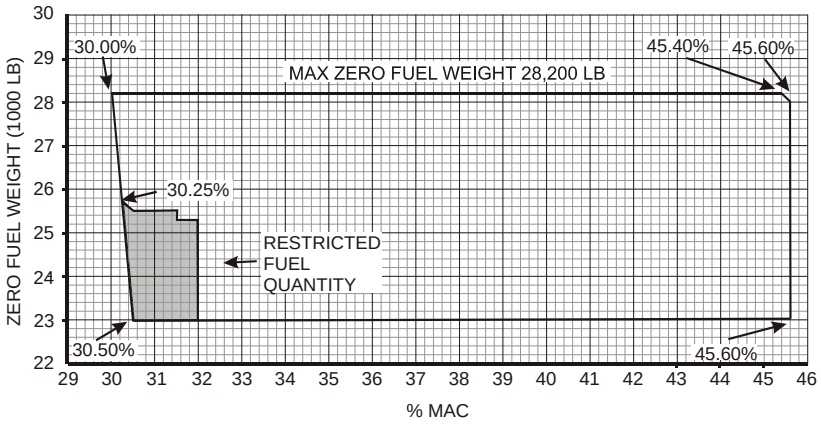
ALLOWABLE OPERATING WEIGHTS (LB)

Maximum Zero Fuel	Maximum Ramp	Maximum Takeoff	Maximum Landing
28,200	39,750	39,600	32,700

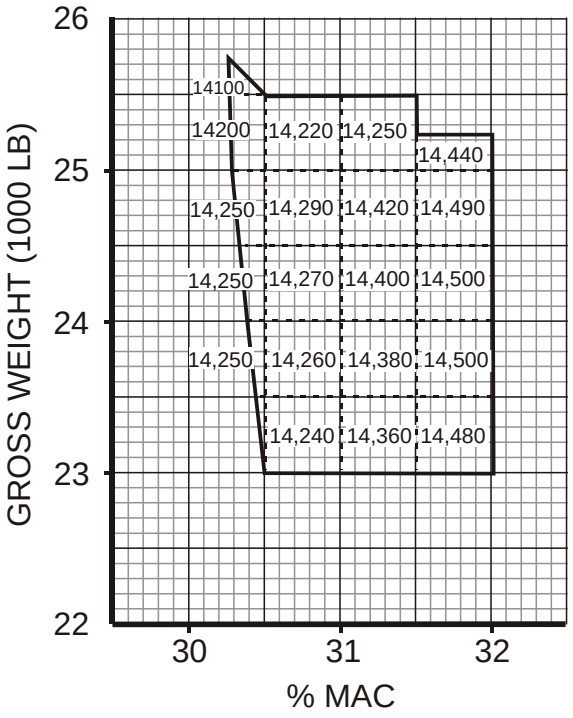
TYPICAL WEIGHT SUMMARY

Item	Weight (LB)
Outfitting - Nominal Weight Empty - Spec. 23,212	23,212
Unusable/Undrainable Fuel (see UNUSABLE FUEL, page VI-5) Engine Oil EMPTY WEIGHT	123 32 23,367
Crew (2) BASIC EMPTY WEIGHT (BEW)	380 23,747
(Operating Items - Typical) - Galley Supplies Beverage Supplies Crew Baggage Navigation Kit & Flight Manual Flight Manuals Lavatory Charges & Supplies Potable Water (10 gallons) Engine Covers OPERATING WEIGHT EMPTY (BOW/OWE)	403 24,150
Passengers (4) Baggage ZERO FUEL WEIGHT (ZFW)	800 200 25,150
Mission Fuel RAMP WEIGHT	14,600 39,750
Start and Taxi Fuel TAKEOFF WEIGHT	-150 39,600

ZERO FUEL WEIGHT ENVELOPE



ZERO FUEL WEIGHT RESTRICTED ZONE FUEL QUANTITY



Example: Between 23,500 lb - 24,000 lb and between 31% - 31.5% MAC, the maximum allowable amount of fuel is 14,380 lb.

ZERO FUEL WEIGHT CG LIMIT

This table enables the operator to ensure that the basic weight cg is within approved limits. The table is used as follows:

1. Obtain the current basic empty weight and moment from FORM C EMPTY WEIGHT AND CG CHANGE LOG, page VI-27 and enter on FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-28
2. Enter on FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-28 the weight and moment for each additional item that is part of the zero fuel weight
3. Add the above items to obtain the zero fuel weight and moment
4. Enter the ZERO FUEL WEIGHT CG LIMIT TABLE, page VI-12 at the ZFW obtained in Step 3
5. Ensure that the appropriate area of the chart is used, in accordance with ZERO FUEL WEIGHT ENVELOPE, page VI-9
6. Divide the moment obtained in step 3 by 10,000. If the moment/10,000 thus obtained is less than the lowest value or more than the highest value on the appropriate line, then the aircraft is not within the allowable cg limits and the loading must be changed accordingly
7. Read vertically from the value obtained in step 4 above to find the aircraft cg, both as a percentage of MAC and as a fuselage station

An alternate method is to divide the moment obtained in Step 3 by the ZFW to obtain the aircraft cg. After using the table in % MAC VS. ARM (IN), page VI-20 to find the center of gravity as a percentage of MAC, ZERO FUEL WEIGHT ENVELOPE, page VI-9 can be used to check the above procedure.

WARNING

AIRCRAFT CG WITHOUT PASSENGERS, CREW, FUEL SHALL NOT EXCEED THE AFT GROUND HANDLING LIMIT OF 462.20 INCHES (50% MAC) DURING ANY STAGE OF GROUND HANDLING OPERATIONS.

FLOOR LOADING LIMITATIONS

Baggage compartment loading, aft of station 508.00: maximum dead weight floor loading is 120 lb per square foot. Maximum compartment loading is 1980 lb. (The difference between 1980 lb and 120 lb per square foot usable floor area must be carried on suitable shelves).

MAIN CABIN FLOOR

Station 178 to station 504, dead weight and cargo loading: Maximum uniform loading is 100 pounds per square foot.

<<END>>

LANDING GEAR EXTENSION EFFECTS ON AIRCRAFT CG

STRUT COMPRESSIONS

Because landing gear shock strut compressions alter the location of the landing gears relative to the aircraft and thus alter the aircraft cg, allowance must be made when weighing the aircraft on wheels. No allowance is necessary when weighing on jacks because all shock struts are fully extended, simulating the in-flight landing gear extended configuration. Reference will be made to three landing gear configurations:

1. In-flight, landing gear extended - (shock struts fully extended).
2. In-flight, landing gear retracted.
3. On ground, landing gear extended - (main struts fully compressed, nose strut fully extended).

IN-FLIGHT, LANDING GEAR EXTENDED OR RETRACTED

The in-flight horizontal movement difference between landing gear retracted and extended is 3433 inch-pounds, which represents an aircraft cg movement aft of 0.1% to 0.15% MAC. depending on weight. Even though this e.g. movement is small, it is necessary to verify that the aircraft cg will remain in the zero fuel weight envelope for both conditions. (See ZERO FUEL WEIGHT ENVELOPE, page VI-9). After computing the aircraft weight and moment (landing gear extended), add 3433 inch pounds from the moment to determine the “inflight landing gear retracted aircraft cg”

ON GROUND, LANDING GEAR EXTENDED

If the aircraft is to be weighed on wheels it must be leveled and this is accomplished by bleeding the main shock struts until fully compressed and inflating the nose strut until the aircraft is level. (See LEVELING THE AIRCRAFT, page VI-23). After computing the aircraft weight and moment it is necessary to subtract 2390 in.-lb from the moment to determine the “in-flight landing gear extended, aircraft cg”. It is emphasized that this correction is not necessary if the aircraft is weighed on jacks.

STATIC BALANCE TOLERANCES ON CONTROL SURFACES

The ailerons surfaces are mass-balanced. The aircraft, as delivered from the production floor, has these surfaces balanced to allow for the weight of paint added by the outfitting facility. The following table displays the acceptable balance ranges. For further details concerning repairs and rebalancing, refer to the Maintenance Manual and balancing procedure.

<table>
<tr><th rowspan="2">Surface</th><th colspan="3">BALANCE MOMENT (IN.-LB)</th></tr>
<tr><th>Unpainted, Unprimed</th><th>Unpainted, Primed</th><th>Final paint</th></tr>
<tr><td>Aileron (nose heavy)</td><td rowspan="2">Not applicable</td><td>One layer of top coat minimum 4.2</td><td rowspan="2">Minimum 2.5</td></tr>
<tr><td>Two layers of top coat minimum 6.0</td></tr>
</table>

AIRCRAFT WEIGHING PROCEDURES

LEVELING AND WEIGHING

PREPARATION FOR WEIGHING

The aircraft can be weighed either on wheels or jacks, (i.e., with the aircraft wheels on floor with platform scales or with jacks and load cells):

The aircraft must be level longitudinally and laterally.

Scales of the following capacities are required:

Wing jacks - 15,000 lb each; forward jack - 3970 lb.

Preparations for weighing is established with:

- Landing gear extended
- Wing flaps retracted
- Main entrance, baggage and lower maintenance doors closed
- Full hydraulic fluid
- Full engine oil
- Full APU oil
- Spoilers retracted
- Fuel tanks drained (the following fluids and/or items should be drained or removed, see step page VI-23)
- Thrust reversers stowed

1. Conduct a complete inventory check according to Master Equipment List (MEL), determine that all required equipment for the EMPTY WEIGHT + UNDRAINABLE FUEL condition is either installed or properly accounted for; any deviations must be recorded as shortages or overages, so that the empty weight may be computed from the actual weight

(Continued)

2. Fluids and/or items that should be drained or removed:
   a. Fuel - Aircraft must be defueled and then drained with the aircraft in ground static attitude (FRL - 1.7° nose down), using the four (4) drain valves on the inboard lower surface of the wing, two (2) drain valves on lower outboard surface of the wing, one (1) drain valve on the forward fuel tank and one (1) drain valve on the aft fuel tank
   b. Lavatory - Fluids and supplies must be removed and/or drained (items not on the equipment list)
   c. Galley and beverage supplies (liquids, foods, etc.) must be removed or drained (items not on the equipment list)
   d. Tools, work equipment, protective material, etc., should all be removed from the aircraft
   e. Exterior should be dry and clean

LEVELING THE AIRCRAFT

Longitudinal leveling is accomplished by placing a clinometer on the seat tracks in middle of cabin across from the emergency exit at sta. 414.7 in (FR 34) in fore and aft direction.
Lateral leveling is accomplished by placing a clinometer on the cockpit floor, sta. 177.8 in (FR 10) in left to right direction.

The aircraft on wheels can be leveled by fully deflating the main landing gear struts and then inflating the nose landing gear strut until the Fuselage Reference Line (FRL) = 0°.

Before weighing on jacks the aircraft must be approximately leveled first, by adjusting the landing gear struts, and the wheel brakes must be off. All jacks should then be raised at the same rate until the final leveling adjustments are made. This prevents any unsafe side loads on components which may cause scale errors.

MEASUREMENTS

When the aircraft is leveled and in the EMPTY WEIGHT + UNDRAINABLE FUEL condition, the dimensions and weights required for WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-25 can be recorded.

With the aircraft on wheels, dimensions C and D must be measured. These distances must be measured because they vary with strut extension. Typical dimensions are C=167.01 inches; D=473.31 inches.

With the aircraft on jacks, no linear measurements are necessary. The arms are given on the WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-25. To obtain the basic empty weight, add 87 lb. at arm 444.65 which represents the unusable less undrainable fuel (see UNUSABLE FUEL, page VI-5).

SAMPLE LOADING CALCULATION

An example of a complete weighing and loading process is as follows:

1. The WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-25, shows the actual weighing results, corrected as necessary for items such as jacks pads and equipment shortages and overages.
2. The FORM C EMPTY WEIGHT AND CG CHANGE LOG, page VI-27 shows subsequent changes affecting the weight and/or balance of the aircraft that must be recorded on this form.
3. The FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-28 shows the derivation of zero fuel weight and ramp weight from the basic weight and balance (WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-25).
4. The resulting zero fuel weight and moment should now be checked using the procedures in ZERO FUEL WEIGHT CG LIMIT TABLE, page VI-12, to ensure that the aircraft is loaded within limits.

INTRODUCTION

GENERAL

This is the weight and balance manual for the Gulfstream G280. aircraft. It is prepared in accordance with FAR 25.1583(c). A copy of this manual with the appropriate aircraft weight and balance data inserted will be delivered to the operator with each aircraft. Gulfstream Aerospace Corporation (GAC) will provide weight and balance data for custom furnishings and avionics for the individual aircraft to which this particular copy of the weight and balance manual applies.

When the aircraft is ready for delivery to the operator, GAC will determine the aircraft weight (by actual weighing) and record the basic weight and cg. The loading of the aircraft then becomes the operator's responsibility. It is important that the basic weight and cg be revised when any changes are made to the aircraft.

AIRCRAFT LOADING DATA

The main purpose of this manual is to ensure that the aircraft is operated within the allowable weight and center of gravity limits. This is achieved by observing the weight limitations listed in ALLOWABLE OPERATING WEIGHTS (KG), page VI-M-7 and using the procedure in ZERO FUEL WEIGHT CG LIMIT, page VI-M-11 to ensure that the zero fuel weight is within the ZFW center of gravity envelope. A complete worked example of the procedure is provided.

DEFINITIONS, page VI-M-4, TYPICAL WEIGHT SUMMARY, page VI-M-8, ZERO FUEL WEIGHT ENVELOPE, page VI-M-9 and ZERO FUEL WEIGHT RESTRICTED ZONE FUEL QUANTITY, page VI-M-10 provide additional data including typical weight summaries and definitions of terms used in this report.

FLOOR LOADING LIMITATIONS, page VI-M-15 points out the possibility of the aircraft tipping back under certain abnormal conditions and shows how to avoid the situation.

LANDING GEAR EXTENSION EFFECTS ON AIRCRAFT CG, page VI-M-16 and STATIC BALANCE TOLERANCES ON CONTROL SURFACES, page VI-M-17 respectively give data about the effect of landing gear position on aircraft cg and control surface mass balancing.

FUEL CG TABLE (GROUND STATIC ATTITUDE -1.7°), page VI-M-18 contains a fuel cg chart. % MAC VS. ARM (M), page VI-M-19 illustrates a table for converting aircraft cg expressed as fuselage stations to percentages of MAC and vice versa.

AIRCRAFT WEIGHING PROCEDURES

AIRCRAFT WEIGHING PROCEDURES, page VI-M-22, contains PREPARATION FOR WEIGHING, LEVELING THE AIRCRAFT and MEASUREMENTS. It deals with the leveling and weighing of the aircraft. (A sample loading calculation is available). In addition to these procedures, scale manufacturer's instructions must be complied with.

EQUIPMENT LISTS

List of standard equipment and list of completion and operational items are furnished by GAC.

RECORD OF AIRCRAFT WEIGHT AND BALANCE

AIRCRAFT WEIGHING PROCEDURES, page VI-M-22 contains forms as follows:
Form A - WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-M-25.
Form C - FORM C EMPTY WEIGHT AND CG CHANGE LOG, page VI-M-27.
Form D - FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-M-28. These forms are used to compute and record weights and centers of gravity, from actual weights to ramp gross weight procedure. Form B is used by the manufacturer for delivery flights to a specific outfitting location. A complete record of this form will be entered into the aircraft's actual weight records. Forms A, C, and D will be used throughout the operational life of the aircraft.
It is recommended that all weight and balance records be preserved, clearly marking those that have been superseded.

AIRCRAFT LOADING DATA

DEFINITIONS

UNITS

All weights in this manual are expressed in kilograms. All lengths in this manual are expressed in meters.

ALLOWABLE OPERATING WEIGHTS

The weight limitations of the aircraft at various flight stages. (see ALLOWABLE OPERATING WEIGHTS (KG), page VI-M-7 for values).

MTW

Maximum Taxi Weight (called also Maximum Ramp Weight) - Maximum weight approved for ground maneuver. It includes weight of start, taxi and run-up fuel.

MTOW

Maximum Takeoff Weight - Maximum weight approved for the start of the takeoff run.

MLW

Maximum Landing Weight - Maximum weight approved for the landing touchdown.

MZFW

Maximum Zero Fuel Weight - The maximum authorized weight of an aircraft without fuel.

MFW

Minimum Flight Weight - The Minimum authorized flight weight of an aircraft. It may be changed as a function of the relevant center of gravity.

BEW

Basic Empty Weight - Empty weight and crew.

(Continued)

BOW

Basic Operating Weight (Called also OWE - Operational Weight Empty) - The empty weight of the aircraft plus the weight of the required crew, their baggage and other standard items such as meals and potable water.

ARM

Called also Y coordinate, measured in inches, uses the location of components and the complete aircraft for longitudinal center of gravity (cg).

MAC

Mean Aerodynamic Chord - A wing reference chord. There is an option to present the longitudinal cg in non dimensional units (an alternative system to arm) of %MAC. This unit system is in use for Weight / cg envelope.

MAC = 2.868; LE MAC from datum = 10.305

The conversion formula between the 2 coordinate systems is:

$$\%MAC = \frac{\text{Arm (m)} - 10.305}{2.868} \times 100$$

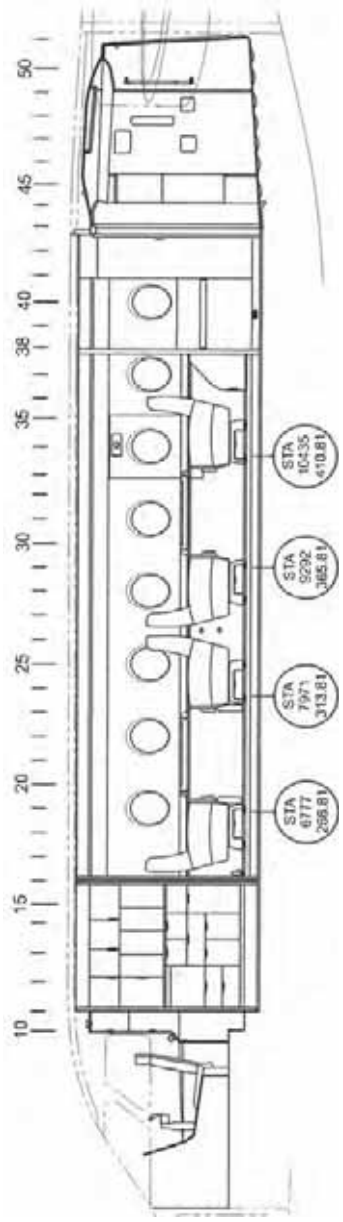
UNUSABLE FUEL

Combined of unusable undrainable fuel and unusable drainable fuel. these quantities are part of the basic weight.

Fuel	Weight (KG)
Undrainable	16
Drainable	39
Total Unusable	55

Other aircraft weight terms can be understood by referencing TYPICAL WEIGHT SUMMARY, page VI-M-8.

AIRCRAFT FUSELAGE STATIONS



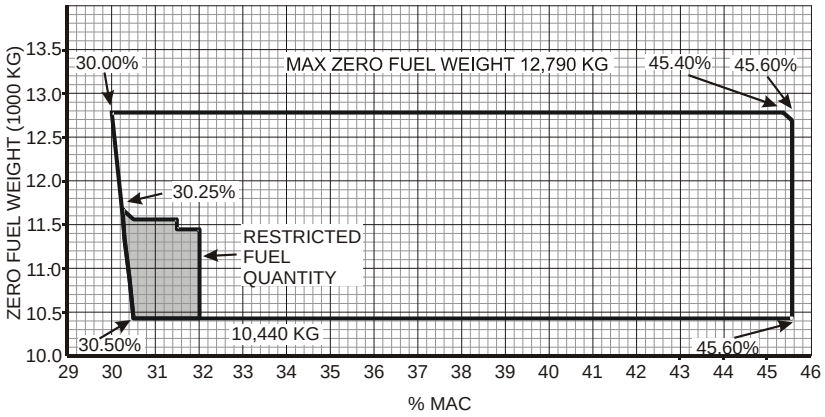
ALLOWABLE OPERATING WEIGHTS (KG)

Maximum Zero Fuel	Maximum Ramp	Maximum Takeoff	Maximum Landing
12,790	18,030	17,960	14,830

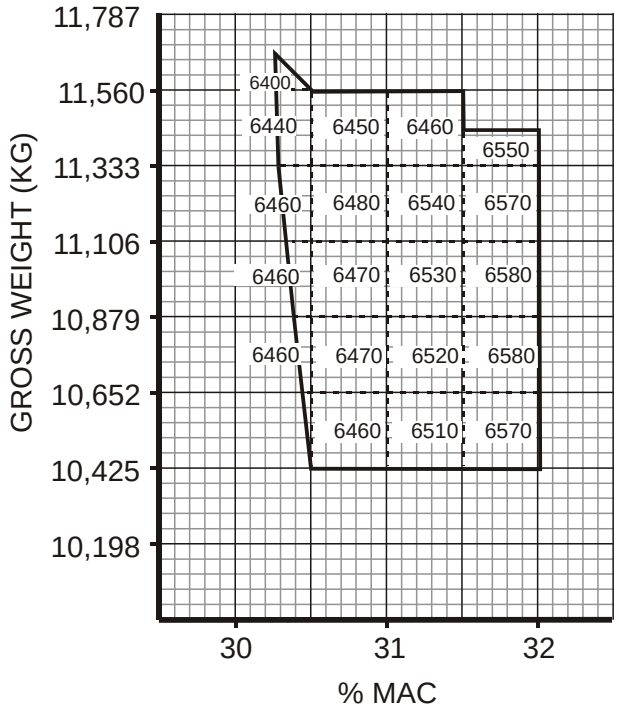
TYPICAL WEIGHT SUMMARY

Item	Weight (KG)
Outfitting - Nominal Weight Empty - Spec. 23,212	10,529
Unusable/Undrainable Fuel (see UNUSABLE FUEL, page VI-M-5) Engine Oil EMPTY WEIGHT	56 15 10,599
Crew (2) BASIC EMPTY WEIGHT (BEW)	172 10,771
(Operating Items - Typical) - Galley Supplies Beverage Supplies Crew Baggage Navigation Kit & Flight Manual Flight Manuals Lavatory Charges & Supplies Potable Water (38 liters) Engine Covers OPERATING WEIGHT EMPTY (BOW/OWE)	183 10,954
Passengers (4) Baggage ZERO FUEL WEIGHT (ZFW)	363 91 11,408
Mission Fuel RAMP WEIGHT	6622 18,030
Start and Taxi Fuel TAKEOFF WEIGHT	-68 17,962

ZERO FUEL WEIGHT ENVELOPE



ZERO FUEL WEIGHT RESTRICTED ZONE FUEL QUANTITY



Example: Between 10,652 kg - 10.879 kg lb and between 31% - 31.5% MAC, the maximum allowable amount of fuel is 6520 kg.

ZERO FUEL WEIGHT CG LIMIT

This table enables the operator to ensure that the basic weight cg is within approved limits. The table is used as follows:

1. Obtain the current basic empty weight and moment from FORM C EMPTY WEIGHT AND CG CHANGE LOG, page VI-M-27 and enter on FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-M-28
2. Enter on FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-M-28 the weight and moment for each additional item that is part of the zero fuel weight
3. Add the above items to obtain the zero fuel weight and moment
4. Enter the ZERO FUEL WEIGHT CG LIMIT TABLE, page VI-M-12 at the ZFW obtained in Step 3
5. Ensure that the appropriate area of the chart is used, in accordance with ZERO FUEL WEIGHT ENVELOPE, page VI-M-9
6. Divide the moment obtained in step 3 by 1000. If the moment/1000 thus obtained is less than the lowest value or more than the highest value on the appropriate line, then the aircraft is not within the allowable cg limits and the loading must be changed accordingly
7. Read vertically from the value obtained in step 4 above to find the aircraft cg, both as a percentage of MAC and as a fuselage station

An alternate method is to divide the moment obtained in Step 3 by the ZFW to obtain the aircraft cg. After using the table in % MAC VS. ARM (M), page VI-M-19 to find the center of gravity as a percentage of MAC, ZERO FUEL WEIGHT ENVELOPE, page VI-M-9 can be used to check the above procedure.

WARNING

AIRCRAFT CG WITHOUT PASSENGERS, CREW, FUEL SHALL NOT EXCEED THE AFT GROUND HANDLING LIMIT OF 11.74 METERS (50% MAC) DURING ANY STAGE OF GROUND HANDLING OPERATIONS.

FLOOR LOADING LIMITATIONS

Baggage compartment loading, aft of station 12.9: maximum dead weight floor loading is 585 kg per square meter. Maximum compartment loading is 898 kg. (The difference between 898 kg and 585 kg per square meter usable floor area must be carried on suitable shelves).

MAIN CABIN FLOOR

Station 4.5 to station 12.8, dead weight and cargo loading: Maximum uniform loading is 488 kg per square meter.

LANDING GEAR EXTENSION EFFECTS ON AIRCRAFT CG

STRUT COMPRESSIONS

Because landing gear shock strut compressions alter the location of the landing gears relative to the aircraft and thus alter the aircraft cg, allowance must be made when weighing the aircraft on wheels. No allowance is necessary when weighing on jacks because all shock struts are fully extended, simulating the in-flight landing gear extended configuration. Reference will be made to three landing gear configurations:

1. In-flight, landing gear extended - (shock struts fully extended).
2. In-flight, landing gear retracted.
3. On ground, landing gear extended - (main struts fully compressed, nose strut fully extended).

IN-FLIGHT, LANDING GEAR EXTENDED OR RETRACTED

The in-flight horizontal movement difference between landing gear retracted and extended is 40 meter-kilogram, which represents an aircraft cg movement aft of 0.1% to 0.15% MAC. depending on weight. Even though this e.g. movement is small, it is necessary to verify that the aircraft cg will remain in the zero fuel weight envelope for both conditions. (See ZERO FUEL WEIGHT ENVELOPE, page VI-M-9). After computing the aircraft weight and moment (landing gear extended), add 40 meter-kilogram from the moment to determine the “inflight landing gear retracted aircraft cg”

ON GROUND, LANDING GEAR EXTENDED

If the aircraft is to be weighed on wheels it must be leveled and this is accomplished by bleeding the main shock struts until fully compressed and inflating the nose strut until the aircraft is level. (See LEVELING THE AIRCRAFT, page VI-M-23). After computing the aircraft weight and moment it is necessary to subtract 27.548 kg•m from the moment to determine the “in-flight landing gear extended, aircraft cg”. It is emphasized that this correction is not necessary if the aircraft is weighed on jacks.

STATIC BALANCE TOLERANCES ON CONTROL SURFACES

The ailerons surfaces are mass-balanced. The aircraft, as delivered from the production floor, has these surfaces balanced to allow for the weight of paint added by the outfitting facility. The following table displays the acceptable balance ranges. For further details concerning repairs and rebalancing, refer to the Maintenance Manual and balancing procedure.

Surface	BALANCE MOMENT (KG•M)		
	Unpainted, Unprimed	**Unpainted, Primed**	**Final paint**
Aileron (nose heavy)	Not applicable	One layer of top coat minimum 0.05	Minimum 0.03
		Two layers of top coat minimum 0.07

AIRCRAFT WEIGHING PROCEDURES

LEVELING AND WEIGHING

PREPARATION FOR WEIGHING

The aircraft can be weighed either on wheels or jacks, (i.e., with the aircraft wheels on floor with platform scales or with jacks and load cells):
The aircraft must be level longitudinally and laterally.
Scales of the following capacities are required:
Wing jacks - 6800 kg each; forward jack - 1800 kg.
Preparations for weighing is established with:

- Landing gear extended
- Wing flaps retracted
- Main entrance, baggage and lower maintenance doors closed
- Full hydraulic fluid
- Full engine oil
- Full APU oil
- Spoilers retracted
- Fuel tanks drained (the following fluids and/or items should be drained or removed, see step page VI-M-23)
- Thrust reversers stowed

1. Conduct a complete inventory check according to Master Equipment List (MEL), determine that all required equipment for the EMPTY WEIGHT + UNDRAINABLE FUEL condition is either installed or properly accounted for; any deviations must be recorded as shortages or overages, so that the empty weight may be computed from the actual weight

(Continued)

2. Fluids and/or items that should be drained or removed:
   a. Fuel - Aircraft must be defueled and then drained with the aircraft in ground static attitude (FRL - 1.7° nose down), using the four (4) drain valves on the inboard lower surface of the wing, two (2) drain valves on lower outboard surface of the wing, one (1) drain valve on the forward fuel tank and one (1) drain valve on the aft fuel tank
   b. Lavatory - Fluids and supplies must be removed and/or drained (items not on the equipment list)
   c. Galley and beverage supplies (liquids, foods, etc.) must be removed or drained (items not on the equipment list)
   d. Tools, work equipment, protective material, etc., should all be removed from the aircraft
   e. Exterior should be dry and clean

LEVELING THE AIRCRAFT

Longitudinal leveling is accomplished by placing a clinometer on the seat tracks in middle of cabin across from the emergency exit at sta. 10.53 m (FR 34) in fore and aft direction.
Lateral leveling is accomplished by placing a clinometer on the cockpit floor, sta. 4.52 m (FR 10) in left to right direction.

The aircraft on wheels can be leveled by fully deflating the main landing gear struts and then inflating the nose landing gear strut until the Fuselage Reference Line (FRL) = 0°.

Before weighing on jacks the aircraft must be approximately leveled first, by adjusting the landing gear struts, and the wheel brakes must be off. All jacks should then be raised at the same rate until the final leveling adjustments are made. This prevents any unsafe side loads on components which may cause scale errors.

MEASUREMENTS

When the aircraft is leveled and in the EMPTY WEIGHT + UNDRAINABLE FUEL condition, the dimensions and weights required for WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-M-25 can be recorded.

With the aircraft on wheels, dimensions C and D must be measured. These distances must be measured because they vary with strut extension. Typical dimensions are C=4.24 meters; D=12.02 meters.

With the aircraft on jacks, no linear measurements are necessary. The arms are given on the WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-M-25. To obtain the basic empty weight, add 39 kg. at arm 11.30 which represents the unusable less undrainable fuel (see UNUSABLE FUEL, page VI-M-5).

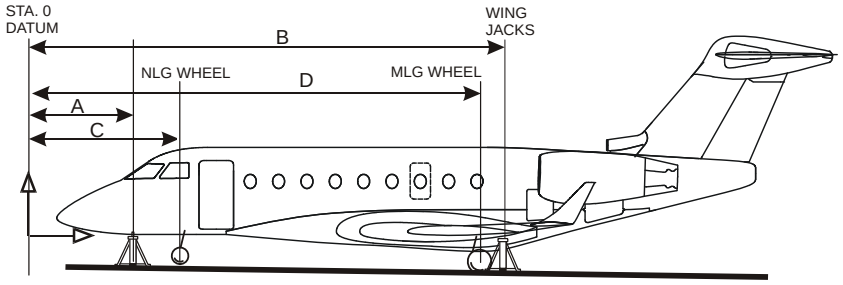
SAMPLE LOADING CALCULATION

An example of a complete weighing and loading process is as follows:

1. The WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-M-25, shows the actual weighing results, corrected as necessary for items such as jacks pads and equipment shortages and overages.
2. The FORM C EMPTY WEIGHT AND CG CHANGE LOG, page VI-M-27 shows subsequent changes affecting the weight and/or balance of the aircraft that must be recorded on this form.
3. The FLIGHT LOADING COMPUTATION FORM (FORM D), page VI-M-28 shows the derivation of zero fuel weight and ramp weight from the basic weight and balance (WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A), page VI-M-25).
4. The resulting zero fuel weight and moment should now be checked using the procedures in ZERO FUEL WEIGHT CG LIMIT TABLE, page VI-M-12, to ensure that the aircraft is loaded within limits.

WEIGHING RECORD - ACTUAL WEIGHT AND BALANCE DATA FORM (FORM A)

GULFSTREAM G280 S/N _____



NOSE JACK REACTION - A = 2.69 M.
NOSE WHEEL REACTION (TYPICAL) - C = 4.24 M.
MAIN JACK REACTION - B = 12.16 M.
MAIN WHEEL REACTION (TYPICAL) - D = 12.02 M.

$$\%MAC = \frac{\text{Arm (m)} - 10.305}{2.868} \times 100$$

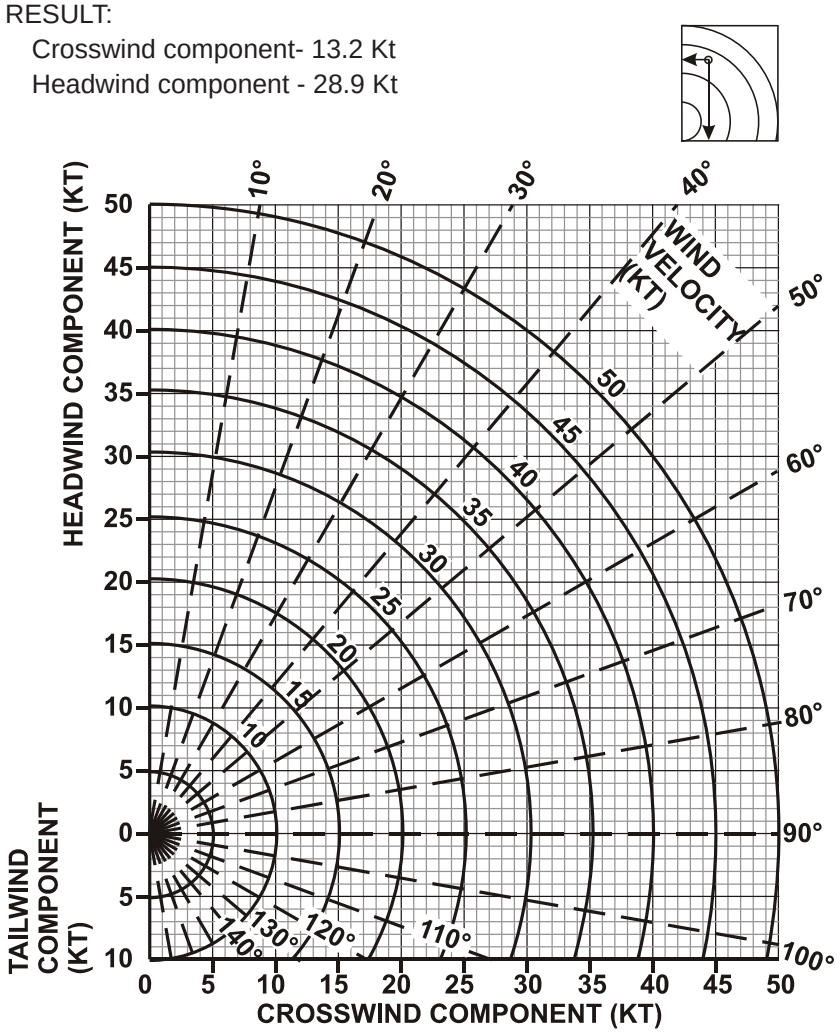
WIND COMPONENTS

EXAMPLE:

GIVEN: Wind direction relative
to runway - 25°
Wind speed - 32 Kt

RESULT:
Crosswind component- 13.2 Kt
Headwind component - 28.9 Kt



VELOCITY CONVERSION

Table values represent the ratio between left column and top row units

UNIT	FEET PER SECOND (FT/S)	METERS PER SECOND (M/S)	KNOTS	KILOMETER PER HOUR (KPH)	MILES PER HOUR (MPH)
FT/S	1	0.304800	0.592484	1.097280	0.681818
M/S	3.28084	1	1.943844	3.60000	2.23694

TWO-ENGINE CLIMB

GENERAL

Climb performance tables are presented for a series of takeoff weights and ambient temperatures.

Normal climb data is based on the following climb schedule:

250 KCAS / 0.75 M_i

The climb calibrated speed should be maintained until the Mach number is intercepted.

If step climb technique is used, deduct figures given to reach present altitude, at current aircraft weight, from figures shown for the desired altitude.

THRUST SETTINGS; TWO-ENGINE NORMAL CLIMB

Altitude	Climb Speed KCAS/M_i	Ambient Temperature at (ISA) (^{O}C)	N_1 (%RPM)

LONG RANGE CRUISE

GENERAL

Long range cruise data is given for approximately 99% of maximum specific range speeds. The data is given as point performance in tabulated form for mission planning purposes.

A chart of optimum altitudes for long range cruise is given as a function of aircraft gross weight.

If constant flight level is maintained for an extended period of time, Mach number should be reduced as the weight of the aircraft is reduced in order to maintain the best specific range.

The prime parameter to stabilize the aircraft is mach number. N_1 data is only given for reference, and deviations in N_1 from aircraft to aircraft are normal.

MAXIMUM CRUISE

Thrust setting is at MAX CRZ and aircraft achieves maximum airspeed/Mach according to current altitude and weight.

If airspeed/Mach accelerates to V_{MO}/M_{MO} - thrust should set to not exceed aircraft operating limitations and maintain V_{MO}/M_{MO}.

MAXIMUM CRUISE TABLES

DESCENT

DESCENT SUMMARY

1. Clean Configuration
2. Descent speed schedule:
   Mach 0.75 . 250 KCAS
   The descent Mach number should be maintained until the calibrated speed is intercepted.
3. Flight idle thrust
4. ISA conditions

NOTE

1. Use linear interpolation between given weight values (25,000 lb and 39,000 lb).
2. Ambient temperature effects:
   For each 10°C above standard temperature:
   Increase descent time by 2%.
   Increase descent distance by 4%.
   Increase required descent fuel by 5%.
   For each 10°C below standard temperature:
   Decrease descent time by 2%.
   Decrease descent distance by 4%.
   Decrease required descent fuel by 5%.

DESCENT TABLES

SINGLE ENGINE OPERATIONS

SINGLE ENGINE DRIFTDOWN

Driftdown data is provided as function of altitude and weight at time of engine failure for either ISA or ISA+20°C temperature.

To attain the driftdown performance shown, the recommended driftdown procedure described below must be followed.

DRIFTDOWN PROCEDURE

1. At the failure of one engine, maximum continuous thrust is set and held on the operating engine during any deceleration, if required to reduce the speed to the entry descent Mach. Any deceleration should be performed at the initial altitude before the start of descent.
2. The descent Mach number should be maintained until the calibrated speed is intercepted. The calibrated speed is then held down to the final driftdown altitude (identified as Cruise Altitude).
3. At the final driftdown altitude, a 200 fpm rate of climb capability will be possible at maximum continuous thrust at the Start Cruise speed shown.
4. Moderate thrust reductions are required at the Cruise Altitude to stabilize at the Start Cruise calibrated airspeed.

NOTE

Start Cruise speeds are the MRC speeds defined for the Cruise Altitude and final driftdown weight.

MAXIMUM RANGE CRUISE

Maximum range cruise data is given for approximately the maximum specific range speeds. The data is given as point performance in tabulated form for mission planning purposes.

If constant flight level is maintained for an extended period of time, Mach number should be reduced as the weight of the aircraft is reduced in order to maintain the best specific range.

The prime parameter to stabilize the aircraft is mach number. N_1 data is only given for reference, and deviations in N_1 from aircraft to aircraft are normal.

SINGLE ENGINE MAXIMUM RANGE CRUISE TABLES

CAAI APPROVED
15 Apr 2015

Appendix No. 1
for
GULFSTREAM G280 AIRCRAFT

CONFIGURATION DEVIATION LIST

GULFSTREAM AEROSPACE LP

CAAI APPROVED
15 Apr 2015

Appendix 1

CONFIGURATION DEVIATION LIST

PURPOSE

This Configuration Deviation List (CDL) contains additional certificate limitations for operation of the Gulfstream 280 without certain secondary airframe and engine parts as listed herein. The certificate limitations in Section 1 are applicable except as amended herein. All CAAI and FAA approved limitations must be followed when operating with a configuration deviation.

APPLICABILITY

This list does not include parts which do not affect the airworthiness of the airplane, such as galley equipment, entertainment systems, passenger convenience items, etc., and is based on the configuration of the airplane as originally manufactured. Secondary airframe parts changed or added during completion or while the airplane is in operation should be addressed by supplementary revisions to the list.

MULTIPLE ITEMS

No more than one part for any subsystem in this list may be missing, unless specifically designated combinations are indicated herein. Unless otherwise specified herein, parts from different subsystems may be missing. The performance penalties are cumulative. The decision of the pilot in command of the flight, to have allowable missing parts corrected prior to flight, will take precedence over the provisions contained in this publication.

If an additional part is lost in flight, the airplane may not depart the airport at which it landed following this event until it again complies with the limitations of this appendix. This does not preclude the issuance of a ferry permit to allow the airplane to be flown to a point where the necessary repairs or replacements can be made.

ACTION REQUIRED

MAINTENANCE LOG

The operator shall list in the airplane logbook an appropriate notation covering the missing part(s) on each flight.

DAMAGE INSPECTION

The operator shall make a thorough check of the airplane to ascertain that other areas have not been damaged or affected.

PLACARDING

The operator shall make a placard by duplicating the complete CDL item from this publication and cut it to size to show only the subject item. Install this placard in a conspicuous location in the cockpit. If the missing part requires a reduction of V_{MO}/M_{MO}, an approved placard for the reduced V_{MO}/M_{MO} must be installed adjacent to the airspeed indicator and any additional restrictions must be placarded for the pilots to easily see.

PERFORMANCE AND FLIGHT PLANNING

The effects of the missing parts will be included in the calculations for takeoff, landing and cruise. Performance penalties for multiple items are cumulative.

Appendix 1

LIMITATIONS

1. The numbering and designation of systems in CDL appendix is based on ATA Specification No. 100. The parts within each system are identified by functional description and, when necessary, by part numbers.
2. When the airplane is operated using this appendix, it must be operated in accordance with the limitations specified in the AFM, as amended by this appendix.
3. The associated limitations must be listed on a placard affixed in the cockpit on the pilot's instrument panel in clear view of the pilot.
4. The pilot shall be notified of each operation with a missing part(s) by listing the missing part(s) in the flight or dispatch release.
5. No more than three parts that have each been determined to cause a negligible performance degradation may be missing for takeoff without applying a performance penalty. When more than three such parts are missing, a performance penalty of either 0.5 percent of the maximum takeoff weight or 100 pounds, whichever is less, must be applied for takeoff, enroute, and landing for each missing part.
6. takeoff performance penalties are applicable to takeoff performance considerations (i.e., takeoff field length, first, second, or final segment climb, or takeoff flight path), or to maximum certified takeoff gross weight.
7. Landing performance penalties are applicable to landing gross weights that are limited by structural limit, landing field length, landing climb, or approach climb.
8. Enroute performance penalties are applicable to operations that are limited by one engine inoperative enroute climb performance.

TERRAIN AWARENESS AND WARNING SYSTEM (TAWS)

This Supplement must be attached to CAAI approved Airplane Flight Manual dated 15 Apr 2015 whenever Terrain Awareness and Warning System (TAWS) is installed.
Information contained herein supplements information in basic Aircraft Flight Manual. For limitations, procedures and performance information not contained in this Supplement, consult basic Aircraft Flight Manual.

CAAI APPROVED: 
Mr. Tamir Bar-Am, Manager
Engineering Branch
Civil Aviation Authority, Israel

Date: 15 Apr 2015 Manual No._____

GULFSTREAM AEROSPACE LP

Supplement 1

TERRAIN AWARENESS AND WARNING SYSTEM (TAWS)

GENERAL

The general information in the introduction section is applicable with the addition of the following:

SECTION I
LIMITATIONS

1. The TAWS may give little or no warning/alert for flight into steeply rising terrain.
2. The TAWS may give little or no warning/alert for stabilized descent in landing configuration into terrain where no ILS glideslope exists and the altitude awareness callouts are not activated.
3. Terrain clearances or descent rates during radar vectoring that are not compatible with those required by the minimum regulatory standards for Ground Proximity Warning equipment may cause unwanted warnings or alerts.
4. This system provides aural and visual windshear warning and alerts only. No flight guidance is presented.
5. Navigation is not to be predicated upon the use of TERRAIN database display.
6. Pilots are authorized to deviate from their current air traffic control (ATC) clearance to the extent necessary to comply with an TAWS warning.
7. The terrain display is intended to serve as situational awareness tool only.and may not provide the accuracy and/or fidelity on which to solely base terrain avoidance maneuvering.
8. The TAWS database, displays and alerting algorithms currently do not account for man-made obstructions.

(Continued)

9. The terrain display must be inhibited by TERR INHIBIT pushbutton on pedestal and get a status CAS if within 15 nm of landing at an airport for which any of the following apply:
   a. The airport has no approved instrument approach procedure
   b. The longest runway is less than 3500 ft long
   c. The airport has incomplete runway data
   d. The airport /approach has the potential to produce a false terrain alert even though the FMS meets normal navigation accuracy requirements

The system aural alerts may be silenced only during malfunction and when it is clear that no ground collision danger is present, by pulling IPC 3 cb.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

No change.

SECTION IV
NORMAL PROCEDURES

SYSTEM ACTIVATION

The TAWS is active when right distribution electrical bus is on, the TAWS Aural Inhibits pushbuttons are not selected on and the following systems are operating:

- Aural GS receiver
- TAWS
- Radar Altimeter
- Air data computer
- GS receiver
- NAV receivers
- Flight Management Computer / GPS
- Gear/flap system
- AHRS or IRS

SELF-TEST

Perform a system test on the ground prior to the first flight of the day. Select TAWS TEST on the SMC – TEST page.

When the TAWS Pilot Initiated Test is activated, the following occur:

- HSI will automatically switch to a 120° compass arc HSI map format.
- Selected range for HSI map will automatically be set to the 5 nm half range ring.
- Terrain overlay will be automatically selected on the HSI map.
- WX, and Traffic overlays will be automatically de-selected on the HSI map.
- TAWS will annunciate aural and visual caution, warning, and INOP cues.

(Continued)

- Map format switches to tactical
- Map reference point switches to aircraft center
- Map orientation switches to heading
- Selected range for map will be automatically be set to the 5nm half range ring
- Terrain overlay will be automatically selected on the map
- All overlays will be automatically de-selected on the map
- TAWS will annunciate aural and visual caution, warning, and INOP cues
- Manual selection of overlay, range, map orientation, and map format will be inhibited while terrain test is in progress.
- Terrain overlay data is removed on any displayed map or HSI where TAWS is selected
- A TAWS Test Pattern is displayed on the Map display
- Flashing TAWS TEST is annunciated on the map display
- Ground PROX Fail and Windshear Fail advisory messages are displayed for 2 seconds
- TERRAIN NOT AVAILABLE advisory message is displayed
- GND PROX flashing yellow annunciation displayed on PFD
- “GLIDESLOPE” aural sounds
- GND PROX yellow annunciation extinguished on PFD
- GLIDESLOPE CANCEL PBA or soft switch control illuminated
- GLIDESLOPE CANCEL PBA or soft switch control extinguished
- TERRAIN NOT AVAILABLE advisory message removed
- Terrain Fail advisory message is displayed
- PULL UP flashing red annunciation is displayed on PFD
- “PULL UP” aural sounds
- PULL UP red annunciation extinguished on PFD
- WINDSHEAR flashing red annunciation is displayed on PFD
- “WINDSHEAR” aural sounds

(Continued)

- WINDSHEAR red annunciation extinguishes on PFD
- WINDSHEAR flashing Yellow annunciation displayed on PFD
- WINDSHEAR yellow annunciation extinguished on PFD
- Terrain Fail advisory message removed
- PULL UP flashing red annunciation is displayed on PFD
- “TERRAIN, TERRAIN, PULL UP” aural sounds
- PULL UP red annunciation extinguished on PFD
- GND PROX flashing yellow annunciation is displayed on PFD
- GND PROX yellow annunciation extinguishes on PFD
- Configured sink rate aural sounds
- Configured mode 1 pull up aural sounds
- Configured terrain aural sounds
- Configured mode 2 pull up aural sounds
- Configured don’t sink aural sounds
- “Too Low Terrain” aural sounds
- “Too Low Gear” aural sounds
- “Too Low Flaps” aural sounds
- “Too Low Terrain” aural sounds
- Configured glideslope (soft) aural sounds
- Configured glideslope (normal) aural sounds
- Configured bank angle aural sounds if enabled
- Configured approaching minimums aural sounds if enabled
- Configured minimums aural sounds if enabled
- 500 ft aural sounds if hard callout enabled (mutually exclusive with smart 500 ft callout)
- Selected altitude callouts aural (s) sounds (those that are selected)
- 500 ft Aural sounds if smart callout enabled (mutually exclusive with hard 500 ft callout)
- Configured windshear warning aural sounds if enabled
- Configured windshear caution aural sounds if enabled (this will not be sounds if windshear caution is enabled without voice)
- Configured terrain clearance floor aural sounds
- Configured terrain caution aural sounds

(Continued)

- Configured terrain warning aural sounds
- Configured obstacle caution aural sounds
- Configured obstacle warning aural sounds
- Ground PROX Fail and Windshear Fail advisory messages removed

The test fails if:

a. Glideslope is inoperative, “Glideslope Inop” aural sounds instead of “Glideslope aural” in short self test
b. GPWS is inoperative, “GPWS Inop” aural sounds instead of “Pull Up” aural in short self test
c. If windshear is inoperative, “Windshear Inop” aural sounds instead of “Windshear” aural in short self test
d. If bank angle is enabled and inoperative, “Bank Angle Inop” aural sounds in short self test.
e. If Mode 6 callouts are enabled and inoperative, “Callouts Inop” aural sounds in short self test

When the TAWS pilot initiated test is complete, the HSI window and 1/4 or 1/2 MFW maps automatically return to the original conditions that existed before the TAWS test.

USER SELECTABLE CALLOUTS

Various callouts are available for user selection. The callouts are:

- Radio Altimeter
- One Thousand
- Five Hundred (Smart)
- Approaching Minimums
- Minimums
- 400 ft
- 300 ft
- 200 ft
- 100 ft
- 50 ft
- 40 ft
- 30 ft
- 20 ft
- 10 ft

RESPONSE TO WARNINGS AND ALERTS

When an TAWS caution occurs, adjust the airplane flight path until the caution ceases.

If an TAWS warning occurs, immediately initiate and continue a climb which provides maximum terrain clearance or similar approved climb terrain escape maneuver, until all alerts cease. Only climb maneuvers are recommended, unless operating in visual meteorological conditions (VMC), and/or the pilot determines, based on all available information, that turning in addition to climb escape maneuver is the safest course of action.

Supplement 1

TAWS ESCAPE PROCEDURE

1. Press TOGA button
2. Disconnect the autopilot and apply thrust levers to the mechanical forward limit and press the APR pushbutton.
3. Rotate at 3° to 4° per second to increase pitch attitude until PLI is displayed.
   Continue to pull until shaker is encountered (airplane symbol passes PLI).
   Maintain 0.85-0.90 N-AOA.
4. Do not retract flaps or landing gear until safe climb-out is assured
5. After recovery and reconfigure of the aircraft deselect APR pushbutton.

"TERRAIN, TERRAIN PULL UP", or, "OBSTACLE, OBSTACLE PULL UP" aural warning: In a TAWS warning event, immediately initiate and continue a climb which provides maximum terrain clearance. Only climb maneuvers are recommended, unless operating in a visual meteorological conditions (VMC), and/or the pilot determines, based on all available information, that turning in addition to climb escape maneuver is the safest course of action.

"CAUTION TERRAIN", "DON'T SINK", "TOO LOW TERRAIN", "SINK RATE" aural caution:
When a TAWS caution occurs, adjust the airplane flight path until the caution ceases.

CAUTION

THE TERRAIN DISPLAY IS INTENDED TO SERVE AS A SITUATIONAL TOOL ONLY AND MAY NOT PROVIDE THE ACCURACY AND/OR FIDELITY ON WHICH TO SOLELY BASE TERRAIN AVOIDANCE MANEUVERING DECISIONS.

CAAI APPROVED
8 Feb 2018

GROUND PROXIMITY WARNING

When an aural “Pull Up” message sounds, execute the TAWS escape procedure until warning stops.
When an aural message other then “Pull Up” sounds, initiate corrective action to remove the cause of the warning.

NOTE

When flying under daylight VFR, should a warning threshold be deliberately exceeded or encountered due to specific terrain or operating procedures at certain locations, the warning may be regarded as caution and the approach may be continued.

BELOW GLIDESLOPE WARNING

When an aural “Glideslope” callout sounds, initiate corrective action to fly the aircraft back to the proper approach glideslope.

NOTE

1. To permit maneuvering on final approach, the aural alert can be cancelled by pressing either G/S INHIB pushbutton once the aircraft descends below 1000 ft AGL. The cancel function is automatically reset above 1000 ft or below 30 ft.
2. This warning is automatically inhibited during localizer back-course operation.

Supplement 1

WINDSHEAR ESCAPE PROCEDURE

WINDSHEAR WARNING (RED):
At any time:
When the aural warning and WINDSHEAR, WINDSHEAR, WINDSHEAR red annunciation warning comes on the PFD, or an obvious wind shear condition is encountered, the following procedure should be followed:

1. Press TOGA button.
2. Disconnect the autopilot and apply thrust levers to the mechanical forward limit and press the APR pushbutton.
3. Rotate at 3° to 4° per second to increase pitch attitude until PLI is displayed.
   Continue to pull until shaker is encountered (airplane symbol passes PLI).
   Maintain 0.85-0.90 N-AOA
4. Do not retract flaps or landing gear until safe climb-out is assured
5. After recovery and reconfigure of the aircraft deselect APR pushbutton.

(Continued)

WINDSHEAR CAUTION (AMBER):

Takeoff:

When the amber WINDSHEAR annunciation comes on the PFD during takeoff, or the crew recognizes signs of increasing performance conditions, the following procedure should be followed:

1. The crew should be alert to the possibility of subsequent decreasing performance (i.e, significant airspeed loss and down draft conditions).
2. Press TOGA button
3. Disconnect the autopilot and apply thrust levers to the mechanical forward limit
4. Maintain target pitch attitude until safe climb out is assured

Final Approach:

When the amber WINDSHEAR annunciation illuminates on the PFD during final approach, or the crew recognizes signs of increasing performance conditions, the following procedure should be followed:

1. The crew should be alert to the possibility of subsequent decreasing performance (i.e., significant airspeed loss and down draft conditions)
2. Wind and gust allowance should be added to the approach speed, increasing thrust if necessary. Consider disengaging the autopilot / auto-throttle
3. Avoid sinking below the approach glide path or letting the thrust levers remain at flight idle for extended periods of time
4. Coupled with other weather factors, the alert should be considered in determining the advisability of performing a go-around

NOTE

Use natural buffet onset to establish upper limit of pitch attitude.

Supplement 1

SYSTEM DESCRIPTION

GENERAL

The TAWS is fed from left Distribution bus through IPC 3 cb.
The following annunciators/pushbuttons are located G/S INHIB on the left and right glareshield. VOICE OVRD, TERR INHIB, RALT OVRD, FLAPS/TAWS OVRD are located on cockpit pedestal.

The TAWS incorporates the functions of the basic ground proximity warning system (GPWS) with added features including the terrain clearance floor, terrain look-ahead alerting and terrain awareness display.

With the use of accurate GPS or FMS information, the TAWS is able to determine present position, track, and ground speed. With this information the TAWS will display and advise the air crew of any potential conflict with terrain. Terrain threats are recognized and annunciated when terrain violates specific computed envelope boundaries on the projected flight path of the aircraft.

A synthetic image of terrain forward of the aircraft can be displayed on the DU's by selecting Terrain LSK from SMC HSI configuration page, when radar is displayed.

The synthetic terrain image replaces radar image and TERRAIN annunciation is displayed.

The TAWS provides visual and aural warnings only of possible terrain danger (Modes 1 through 4) and for excessive deviation below an ILS glideslope (Mode 5). The system also provides aural alerts for descent below pre-defined altitudes (AGL) during final approach, including a minimum descent altitude awareness callout and an aural alert for excessive bank angle (Mode 6), as well as windshear warning and caution alerting (Mode 7).

TERRAIN PROXIMITY WARNING

Terrain Clearance Floor

The Terrain Clearance Floor (TCF) alert function adds an additional element of protection to the standard Ground Proximity Warning System by alerting the pilot of possible premature descent for non-precision approaches regardless of aircraft configuration. It creates a terrain clearance envelope around the airport, to provide protection against Controlled Flight Into Terrain (CFIT) situations beyond that of the basic GPWS. TCF alerts are based on current aircraft location, nearest runway center point position and radar altitude. TCF is active during takeoff, cruise and final approach.

This alert mode complements the existing Mode 4 protection by providing an alert based on insufficient terrain clearance even when in the landing configuration. Alerts for TCF illuminate TERR INHIB cockpit lights and produce the aural message “Too Low Terrain”. This audio message will repeat once when initial envelope penetration occurs, and one time thereafter for each 20% degradation in radar altitude. The TERR INHIB cockpit lights will remain on until the alert envelope is exited.

Based on aircraft position, flight path angle, track and speed, look ahead algorithms are able to project a “ribbon” ahead of the aircraft. This ribbon originates below the aircraft as an added margin for safety, and uses the terrain clearance floor altitude as a baseline for looking into the database.

When conditions are such as to generate a terrain caution alert or terrain warning, a specific audio alert and light output are triggered and the background image is enhanced to highlight the terrain threats. At the start of the Terrain Caution alert (typically 30 seconds prior to potential terrain conflict), the terrain awareness function triggers the GND PROX annunciator and the caution audio message “Caution Terrain, Caution Terrain”. This is repeated every seven seconds as long as the aircraft is still in the caution envelope.

(Continued)

When conditions have been met to generate a terrain warning (typically 60 seconds prior to potential terrain conflict), the terrain awareness function triggers GND PROX annunciator and the warning audio phrase “Terrain, Terrain, Pull Up”. The phrase “Pull Up” is then The Terrain Awareness Display (TAD), if available, displays an image of surrounding terrain in varying density dot patterns of green, yellow and red. The display is generated from the aircraft altitude compared to terrain data in the TAWS computer. With terrain data available, these dot patterns represent specific terrain separation with respect to the aircraft. Areas with no terrain data available are painted with the low-density magenta. Terrain more than 2000 ft below the aircraft is not displayed.

repeated continuously while the aircraft is within the warning envelope.

TERRAIN AWARENESS DISPLAY

NOTE

1. Terrain is not shown if more than 2000 ft below the aircraft altitude, and/or:
2. Terrain is not shown if the terrain elevation is within 400 ft of the runway elevation nearest the aircraft.

When a “Caution Terrain” alert is generated (typically 60 seconds prior to potential terrain conflict), areas within ±90° of the aircraft track, where terrain penetrates the terrain caution envelope, are painted with the caution color solid yellow.

When a “Terrain, Terrain Pull Up” warning is generated (typically 30 seconds prior to potential terrain conflict), areas within ±90° from the aircraft track where terrain penetrates the terrain warning envelope, are painted with the warning color solid red.
This visual assessment of the terrain situation provides timely alerting and situational awareness for the air crew.

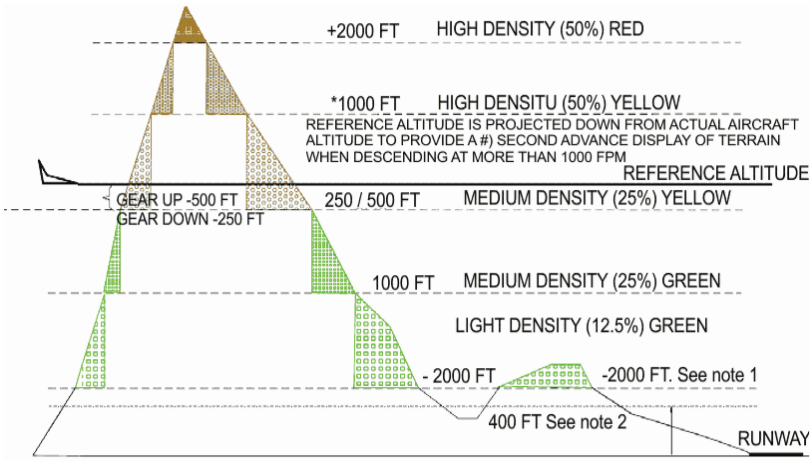

Figure 6-1-1. Terrain Background Display

NOTE

1. Terrain is not shown if more than 2000 ft below reference altitude.
2. Terrain is not shown if within 400 ft of runway elevation nearest the aircraft.

OBSTACLE ALERTING

Obstacle location information, which is integrated into the TAWS terrain database, covers the majority of the world.

The obstacle caution and warning alerts are processed identical to terrain; obstacles are presented on the cockpit displays as terrain, employing the same display coloring scheme. The start of the obstacle caution alert (typically 60 seconds prior to potential obstacle conflict) triggers the GPWS lights and the caution callout “Caution Obstacle, Caution Obstacle”. This is repeated every seven seconds as long as the aircraft is still in the caution envelope.

When conditions have been met to generate an Obstacle Warning Alert (typically 30 seconds prior to potential obstacle conflict), the warning audio phrase “Obstacle, Obstacle, Pull Up”. The phrase “Pull Up” is repeated continuously while the aircraft is within the warning envelope.

ALERTS AND WARNINGS

In flight, the TAWS provide warnings and alerts under the following conditions:

Mode 1 - Excessive Descent Rate

Mode 1 provides warnings for excessive descent rates with respect to altitude AGL. This mode has an inner and outer warning boundary. Penetration of the outer warning boundary activates the PULL UP lights and message “Sink Rate”. Further penetration to the inner boundary leaves the PULL UP lights on, but changes the message to “Pull Up”.

Mode 2 - Excessive Closure to Terrain

Mode 2 provides alerts and warnings to help protect the aircraft from impacting the ground when rapidly rising terrain with respect to the aircraft is detected. Mode 2 is based on radar altitude and on how rapidly radar altitude is decreasing (closure rate). Mode 2 exists in two forms, 2A and 2B.

Mode 2A

Mode 2A is active during climbout, cruise and initial approach (flaps not in landing configuration and aircraft not on glideslope centerline). If the aircraft penetrates the Mode 2A alerting envelope, the message “Terrain, Terrain” is generated and the cockpit GPWS annunciators come on. If the aircraft continues to penetrate the envelope, the warning message “Pull Up” is repeated continuously until the warning envelope is exited.

Upon exiting the warning envelope, if terrain clearance continues to decrease, the message “Terrain” will be given until the terrain clearance stops decreasing. In addition, the visual alert will remain on until the aircraft has gained 300 ft of barometric altitude, 45 seconds has elapsed or the flap override switch is activated.

Supplement 1

Mode 2B

Mode 2B is selected with flaps in landing configuration or when making an ILS approach with Glideslope deviation more then ± 2 dots. Warnings for Mode 2B activate the PULL UP lights and the continuous aural message “Terrain” until the terrain closure rate falls below warning levels.

Mode 3 - Altitude Loss After Takeoff or Go Around

Mode 3 provides warnings for significant altitude loss after takeoff, or low altitude go-around (less than 245 ft AGL) with gear or flaps not in landing configuration. Mode 3 is active during first, second and third segment climb-out. Mode 3 warnings activate the PULL UP lights and aural message “Don’t Sink”. The aural message is only repeated twice unless altitude loss continues to accumulate.

Mode 4 - Unsafe Terrain Clearance

Mode 4 provides alerts and warnings for insufficient terrain clearance with respect to phase of flight and speed. Mode 4 exists in three forms, 4A, 4B and 4C:

Mode 4A is active during cruise and approach with gear not in landing configuration. Warnings for mode 4A activate the PULL UP lights and the aural message “Too Low Gear”, or if airspeed is greater than 190 KCAS, “Too Low Terrain”. These messages will only be repeated twice unless terrain clearance continues to decrease.

Mode 4B is also active during cruise and approach, but with gear in landing configuration. Warnings for Mode 4B activate the PULL UP lights and the message “Too Low Flaps”, or if airspeed is greater than 159 KCAS, “Too Low Terrain”. These messages will only be repeated twice unless terrain clearance continues to decrease.

(Continued)

Mode 4C is active after takeoff or low altitude go-around (less than 245 ft AGL) with gear or flaps not in landing configuration. Mode 4C is active during first, second and third segment climb-out. Warnings for Mode 4C activate the PULL UP lights and the message “Too Low Terrain”. These messages will only be repeated twice unless terrain clearance continues to decrease.

Mode 5 - Excessive Glideslope Deviation

For normal descent rates above 500 FPM, Mode 5 Glideslope alerts are provided when the aircraft is below 1000 ft AGL with gear down and the deviation exceeds 1.3 dots below the ILS Glideslope.
For descent rates between 500 FPM and 0 FPM (level flight or descent rates), Mode 5 glideslope alerts are linearly reduced from 1000 ft to 500 ft AGL.
For level flights or climb rates, Mode 5 glideslope alerts are enabled at 500 ft AGL or less.
More deviation is required to give an alert below 150 ft AGL. The alert becomes more frequent and louder (hard alert) if the condition worsens.
Alerts for Mode 5 activate the “Glideslope” message.

Mode 6 - Advisory Callouts

The Mode 6 function provides callouts for descent through predefined altitudes AGL, including descent through DH. The Mode 6 callouts function is active during the final approach phase of flight. Each callout is only annunciated once per approach.
Radar altitude callouts currently installed include the following, in the order listed

“One Thousand” - at 1000 ft AGL
“Five Hundred” - at 500 ft AGL

Supplement 1

Minimums Callout

A “Minimums-minimums” or “Minimums” callout occurs once on descent based upon pilot radar altimeter indicator decision height (DH) bug setting. This callout is available only for DH bug settings between 1000 ft AGL and 10 ft AGL.

The “Minimums-minimums” or “Minimums” callout has a higher priority than an altitude callout. For example, if the DH bug was set at 200 ft and there is also a “Two Hundred” callout, only the “Minimums” callout would be annunciated.

A “Plus 100" at DH + 100 or “Approaching Minimums” callout may occur at decision height plus one hundred ft if this option has been enabled.

Smart 500 ft Callout

The Smart callout is designed to assist pilots conducting non-precision approaches, while remaining silent during a precision approach where vertical guidance is provided. This feature is provided in addition to the standard “Five Hundred” callout available in many of the altitude callout menus.

The Smart callout will annunciate “Five Hundred” at 500 ft AGL if the pilot instruments are not selected to an in-use ILS signal source. The “Five Hundred” callout will also occur if on an ILS glideslope with a deviation greater than 2 dots from either the glideslope or localizer centerline.

Tones

A two second tone is provided at 100 ft, a 1 second tone at 35 ft and a 1/2 second tone at 20 ft if this option has been enabled.

Bank Angle Callout

The callout “Bank Angle, Bank Angle” advises of a roll attitude that is excessive for the flight conditions. Below 150 t AGL, the callout angle is reduced progressively with altitude from ±40° at 150 ft to ± 10° at 30 ft. Below 30 ft the callout occurs at ±10° and is inhibited below 5 ft. Above 150 ft AGL, a bank angle alert will occur at ±40°. Above 150 ft AGL, the bank angle envelope is expanded linearly from ±40° at 150 ft AGL to ± 55° at 2450 ft.
The callout occurs again if roll attitude increases by 20%. When roll attitude increases to 40% above the initial callout angle, the callout repeats continuously.

Bank Angle

Use of Mode 6 can also enable bank angle warnings messages. The bank angle warning mode is provided to give the pilot a warning indication for inadvertent over banking during all phases of flight.

An aural warning consisting of “Bank Angle Bank Angle” is given once, when bank angle exceeds 55° above 2000 ft or 10° at 30 ft or below. Follow on aural messages are only allowed when the aircraft roll angle increases an additional 20% from the previous alert. After the roll angle increases 20% a third time, the “Bank Angle Bank Angle” message becomes continuous with a 3 second pause between sets of messages.

Supplement 1

Mode 7 - Excessive Windshear Detection

In flight the system provides windshear warnings and alerts under the following conditions:

Mode 7 windshear warnings and alerts are provided between 10 and 1500 ft AGL during takeoff and final approach phases of flight, when the level of windshear exceeds predetermined threshold values. The actual windshear value which is measured represents the vector sum of inertial vertical speed air mass accelerations along the flight path and perpendicular to the flight path. These shears result from vertical winds and rapidly changing horizontal winds.

Windshear warnings are given for decreasing headwind (or increasing tail wind) and severe vertical downdrafts. Windshear warnings activate the red/yellow WINDSHEAR annunciator on the PFD and the message “Windshear, Windshear, Windshear”. The message will not repeat unless another event occurs, but the warning lights stay on for as long as the decreasing headwind/downdraft condition persists. The warning threshold is normally set at 0.115g's, which represents approximately 2.2 kt per second horizontal wind change or 15 kt downdraft. A bias of 0.01 g is added during takeoff or go-around for better climb performance. The threshold is modulated as a function of flight path angle. The threshold is sensitized for unusual air temperature fluctuations typically associated with the leading edge of microburst windshear.

Windshear alerts are given for increasing headwind (or decreasing tailwind) and vertical updrafts typically associated with the leading edge of microburst windshear. Windshear alerts activate the WINDSHEAR annunciators on the DU only, no aural message is given. The alert light stays on for as long as the increasing headwind/ updraft condition persists. The warning threshold is nominally set at 0.115g's, which represents approximately 2.2 kt per second horizontal wind change or 15 kt updraft. A bias of 0.01 g is added during takeoff or go-around for better climb performance.

Taws Messages

HSI/MFD Map:

Terrain Fail advisory message - The message comes on in the overlay fault field on the right side of the HIS when the Terrain Awareness Warning System (TAWS) overlay display data is missing or invalid. The message flashes for 5 seconds and then changes to a steady-on state.

The terrain overlay is not available for selection when this message is being shown.

TCAS II TSS-4100 SYSTEM

This Supplement must be attached to CAAI approved Airplane Flight Manual dated 15 Apr 2015 when Collins TCAS (part of TSS-4100) is installed.
Information contained herein supplements information in basic Aircraft Flight Manual. For limitations, procedures and performance information not contained in this Supplement, consult basic Aircraft Flight Manual.

Engineering Branch
Civil Aviation Authority, Israel

Date: 15 Apr 2015 Manual No._____

Supplement 2

TCAS II TSS-4100 SYSTEM

GENERAL

This supplement covers the operation of Collins TCAS system (part of TSS-4100 system).
The TCAS function provides the following capabilities:

- Transmit on 1030 MHz
- Receive on 1090 MHz
- DO-185B [73] Change 7.1 compliant and Reduced Vertical Separation Minimum (RVSM) compatible, which makes it ACAS (JAA/Eurocontrol) compatible
- Active surveillance of Air Traffic Control Radar Beacon System
- (ATCRBS) and Mode S Intruders
- Collision Avoidance tracking
- Threat detection and resolution
- Communication and coordination

The system complies with TCAS II version 7.1 TSO C119c.
The general information in the introduction section is applicable with the addition of the following:

SECTION I
LIMITATIONS

1. Pilots are authorized to deviate from their current ATC clearance to the extent necessary to comply with a TCAS II resolution advisory (RA).
2. If flight crew is advised by ATC to disable transponder altitude reporting, TCAS must be switched off using the ATC/TCAS Control Page.

ENGINE FAILURE

During an engine failure and when time permits, switch to TA ONLY mode.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

No change.

SELF-TEST

1. The TCAS II system should be tested prior to flight. Select TCAS TEST on the SMC – TEST page.

NOTE

When the TCAS Test is activated and a MFW Map is displayed, the following shall occur:

- Map format switches to tactical
- Map reference point switches to aircraft center
- Map orientation switches to heading
- Selected range for map will be automatically be set to the 5nm half range ring
- TCAS overlay will be automatically selected on the map
- All overlays except for traffic and terrain will be removed from the MFW NAV map

2. After completion of self-test, “Tcas System Test Ok” audio message sounds
3. If “Tcas System Test Fail” sounds or a ATC 1-2/TCAS Fail advisory message comes on, log for maintenance and check MMEL for dispatch restrictions.

NOTE

TCAS self-test cannot be performed in flight.

TCAS II SYSTEM OPERATION

1. Compliance with a TCAS II resolution advisory (RA) is necessary, unless the pilot considers it unsafe to do so, or unless the pilot has better information about the cause of the RA and can maintain safe separation from a nearby aircraft, obvious TCAS II system failure, etc.

CAUTION

1. ONCE AN RA HAS BEEN ISSUED, SAFE SEPARATION COULD BE COMPROMISED IF CURRENT VERTICAL SPEED IS CHANGED, EXCEPT AS NECESSARY TO COMPLY WITH THE RA. THIS IS BECAUSE TCAS II TO TCAS II COORDINATION MAY BE IN PROGRESS WITH THE INTRUDER AIRCRAFT, AND ANY CHANGE IN VERTICAL SPEED THAT DOES NOT COMPLY WITH THE RA MAY NEGATE THE EFFECTIVENESS OF THE OTHER AIRCRAFT'S COMPLIANCE WITH THE RA.
2. THE CONSEQUENCES OF NOT FOLLOWING AN RA MAY RESULT IN ADDITIONAL RA'S IN WHICH AURAL ALERT AND VISUAL ANNUNCIATIONS MAY NOT AGREE WITH EACH OTHER.

2. Do not initiate evasive maneuvers using information from the traffic display only or on a traffic advisory (TA) without visually sighting the traffic. These displays and advisories are intended only for assistance in visually locating the traffic, and lack the flight path trends, necessary for use in evasive maneuvering. However, while climbing or descending, modest changes in vertical speed based on traffic display information are not considered evasive maneuvering

(Continued)

3. Following a TCAS II “Clear Of Conflict” advisory, expeditiously return to the applicable ATC clearance unless otherwise directed by ATC
4. Radar altimeter – ON

TCAS II SYSTEM OPERATING CHARACTERISTICS

TCAS Resolution Advisories (RA) are inhibited below some radio altitudes. The table below gives the TCAS inhibits created by the radio altimeter and the associated RA status.

RADIO ALTITUDE STATUS	RESOLUTION ADVISORY (RA)
Below 1450 FT AGL	“INcrease Descent” RA inhibited
Below 1000 FT AGL descending; Below 1200 FT AGL climbing	“Descend” RA inhibited
Below 900 FT AGL descending; Below 1100 FT AGL climbing	All RA’s inhibited (TA only) and TA aural message inhibited
Below 400 FT AGL descending Below 600 FT AGL climbing	TA aural message inhibited

The aircraft is capable of completing a “Climb” and “INcrease Climb” RA maneuver at most altitudes and weights allowed in the Limitations section of the AFM and at all cruise altitudes up to the cruise ceilings presented in the Operational Planning Manual.

RECOMMENDED INFLIGHT PROCEDURES

1. Flight director pitch commands may be followed only if they result in a vertical speed which satisfies the RA command
2. It is possible in some cases to have insufficient aircraft performance to follow the TCAS RA command without flying into stall warning or buffet. Conditions where this may occur include:
   a. Bank angle in excess of 15°
   b. Operation at airports above 15,000 ft MSL or temperatures outside ISA +20° C
   c. Speeds below 1.3 V_{S1} operating speeds
   d. Buffet margin less than 0.3 g
   e. Failure to configure for go-around following a climb RA in landing configuration
   f. Abnormal configurations which reduce performance. (e.g., gear not retractable)
   g. TCAS command reversal to a “Climb-climb Now”
   h. Structural icing which may affect aircraft performance

NOTE

1. TCAS will continue to provide RA commands during stall warning.
2. If high speed buffet is encountered when initially responding to an RA, relax pitch force as necessary to reduce buffet, but continue the maneuver.
3. TCAS mode will default automatically to TA only mode following an inflight engine shutdown.

(Continued)

If a maneuver is required:

1. Autopilot ..... DISCONNECT
2. Thrust ..... AS REQUIRED
3. Pitch ..... AS REQUIRED TO COMPLY WITH RA

If TCAS "Climb" or "Increase Climb" RA occurs when configured for landing:

1. Autopilot ..... DISCONNECT
2. Engines ..... TAKEOFF THRUST
3. Flaps lever- 20°
4. Pitch ..... AS REQUIRED TO COMPLY WITH RA
5. Gear ..... UP WITH POSITIVE RATE OF CLIMB

NOTE

If stall or TAWS warning comes on during an RA maneuver immediately abandon the RA maneuver and execute the applicable recovery procedure.

Immediate, smooth response to an RA is required to obtain maximum separation. While TCAS II RA algorithms are based upon the pilot initiating the initial maneuver within 5 seconds of the RA, and within 2½ seconds for additional corrective RA's (increase or reversal) that may be issued, any delay in responding to RA's will reduce the separation provided.

If ATC requires that transponder altitude reporting be disabled, switching to ALT OFF on ATC/TCAS Control Page automatically causes TCAS to be in standby mode (TCAS OFF on MAP/HSI).

TCAS II SYSTEM RESOLUTION ADVISORY (RA) AND TRAFFIC ADVISORIES (TA) ANNUNCIATIONS

Resolution advisories (RA) are shown on the PFD as RED and GREEN sectors. The pilot should establish rate of climb or descent as indicated by the green sector on the PFD display, according to system annunciation per the table below.
RA's and TA's audio advisories are annunciated as follows:

TCAS AURAL ADVISORY ANNUNCIATIONS
(Sheet 1 of 4)

Advisory	Version 7.1 Annunciation	Proper Pilot Response
Clear	Clear Of Conflict	Resume normal flight, apparent conflict of airspace has been resolved
Traffic	Traffic Traffic	Gain visual contact of traffic. Check TCAS display for traffic bearing and range if necessary. Assess the threat and prepare to execute the evasive maneuver TCAS issues

TCAS AURAL ADVISORY ANNUNCIATIONS
(Sheet 2 of 4)

Preventive RA	Monitor Vertical Speed	Be alert for approaching traffic. Ensure that the aircraft pitch attitude or vertical speed does not enter the red zone on the attitude display or vertical speed scale.
	Maintain Vertical Speed, Maintain	Maintain present pitch or vertical speed and direction. Ensure that the aircraft pitch or vertical speed does not enter the red zone on the attitude display or vertical speed scale.
	Maintain Vertical Speed Crossing Maintain	A flight path crossing is predicted, but being monitored by TCAS. Maintain present pitch or vertical speed and direction. Ensure that the aircraft pitch or vertical speed does not enter the red zone on the attitude display or vertical speed scale.

TCAS AURAL ADVISORY ANNUNCIATIONS
(Sheet 3 of 4)

Corrective RA	Level Off	Weakening of the RA. Reduce vertical speed to 0 fpm, as indicated on attitude display or vertical speed scale.
	Climb, Climb	Change vertical speed to 1500 fpm climbing, as indicated on attitude display or vertical speed scale.
	Climb, Crossing Climb Climb, Crossing Climb	Same as CLIMB, except that it further indicates that flight paths will cross at some altitude
	Descend, Descend	Change vertical speed to 1500 fpm descending, as indicated on attitude display or vertical speed scale.
	Descend, Crossing Descend	Same as DESCEND, except that it further indicates that flight paths will cross at some altitude

TCAS AURAL ADVISORY ANNUNCIATIONS
(Sheet 4 of 4)

Corrective RA	Increase Climb, Increase Climb	This follows Climb advisory. The climb vertical speed should be increased, typically to 2500 fpm, as shown on attitude display or vertical speed scale.
	Increase Descent, Increase Descent	This follows Descend advisory. The descent vertical speed should be increased, typically to 2500 fpm, as shown on attitude display or vertical speed scale.
	Climb, Climb Now Climb, Climb Now	This follows a Descend advisory. It indicates that a reversal of vertical speed from descent to climb is needed to provide adequate separation
	Descend, Descend Now Descend, Descend Now	This follows a Climb advisory. It indicates that a reversal of vertical speed from climb to descent is needed to provide adequate separation

TCAS II SYSTEM DESCRIPTION

GENERAL

The TCAS II System is an on-board traffic alert and collision avoidance system which monitors a radius of at least 14 nautical miles around the aircraft and, by interrogating any “intruding” aircraft's transponder, determines if a potential airspace conflict exists and sends audio alerts and displays climb/descent instructions on the HSI Map and MFD Map. Traffic data may be displayed on the MFD (Figure 6-2-1). This is done by computing the range, altitude, bearing, and closure rate of other transponder-equipped aircraft, with respect to the TCAS-equipped aircraft.

The TCAS system is fed from left Distribution bus through ATC 1/TCAS cb. It is controlled from the DU Tune page and CDUs.

The ATC/mode S transponder is a solid-state, airborne, air traffic control (ATC) transponder that responds to ATCRBS (Air Traffic Control Radar Beacon System) mode A, mode C and mode Select (MODE S) interrogations. The mode S function is capable of being discretely addressed (so that interrogation can be directed to a specific aircraft as required by TCAS II) and for receiving and sending data link messages. It is also capable of receiving and transmitting from two antennas (for use in diversity operations for improving air-to-air surveillance and communications).

TCAS requires that mode S transponder and air data computer are functional and operating.

(Continued)

The TCAS II System provides two levels of threat advisories:

If the traffic gets within approximately 48 seconds of projected Closest Point of Approach (CPA), it is then considered an intruder, and an aural and visual traffic advisory (TA) is issued. This level calls attention to a developing collision threat using the TCAS II traffic advisory indicators on the HSI Map and MFD Map, and TCAS synoptic if displayed) and voice message, “Traffic Traffic”. It permits mental and physical preparation for a possible maneuver to follow, and emphasizes the importance for the pilot to respond promptly by scanning for the intruder.

If the intruder gets within approximately 20 seconds of CPA, it is considered a threat and an aural and visual resolution advisory (RA) is issued. This level provides a recommended vertical maneuver using the TCAS II indications and messages to provide adequate vertical separation from the threat aircraft or prevents initiation of a maneuver that would place the TCAS II aircraft in jeopardy. The pilot should respond immediately to an RA even if the intruder is not in visual contact.

The TCAS II System resolves multiple aircraft encounters. The TCAS II is considered a backup system to the “See-and-avoid” concept and the ATC radar environment.

Supplement 2

ALTITUDE THRESHOLDS FOR RVSM

Vertical thresholds for traffic advisories and resolution advisories are as follows:

Description	Version 7.1	
Own Altitude	20,000 ft to 42,000 ft	above 42,000 ft
TA	850 ft	1200 ft
Preventative RA	700 ft	800 ft
Corrective RA	600 ft	700 ft

STANDARD TCAS II DEFINITIONS

1. TCAS II - Traffic Alert and Collision Avoidance System that utilizes interrogation of, and replies from transponders. It provides traffic advisories (TA) and resolution advisories (RA) in the vertical plane.
2. Other Traffic - any other traffic within the range of the display and within 2700 feet vertically.
3. Proximate Traffic - any traffic not generating an RA or TA but which is within six nautical miles (nm) slant range and within 1200 ft vertically.
4. Traffic Advisory (TA) - information given to the pilot pertaining to the position of intruding aircraft in the immediate vicinity. The information contains no suggested maneuver.
5. Threat - traffic that has satisfied the threat detection logic and requires a Resolution Advisory (RA).
6. Resolution Advisory (RA) - a display indication given to the pilot recommending a maneuver to increase vertical separation relative to an intruding (threat) aircraft.
   a. Corrective Advisory - a Resolution Advisory that instructs the pilot to deviate from current vertical rate.
   b. Preventive Advisory - a Resolution Advisory that instructs the pilot to avoid certain deviations from current vertical rate.

TCAS II CONTROLS AND INDICATORS

The TCAS II is controlled from the DU Tune page and CDUs. The ATC/TCAS Control page has the following modes:

Source display - indicates TCAS information being displayed.

Mode display - indicates the selected TCAS mode (AUTO, STBY, TA/RA, TA Only, ALT On, ALT Off)

In AUTO (normal) mode both traffic and resolution advisories may be displayed on HSI Map and MFD Map. AUTO mode changes TCAS mode to TA ONLY on takeoff, until 1200 ft, then TA/RA, and to ALT ON after landing.

In STBY mode the TCAS does not transmit.

In TA ONLY, mode only traffic advisories are displayed on the DU.

In ALT ON – Transponder only - Mode C.

In ALT OFF – Transponder only - Mode A.

ATC SEL is a multi state toggle to select the active transponder from ATC1 and ATC2.

ALT tag - ALT Tag is a multi state toggle to select the format of the altitude tag for traffic

displayed on TCAS formats and overlays. The operator can select REL (Relative) or ABS (Absolute).

ALT - ALT is a numeric display of the altitude source and reporting altitude.

TEST - press to initiate TCAS self test.

TRAFFIC display - indicates that the display of other traffic on the DU is enabled (ON) or disabled (OFF).

Other traffic is displayed as open diamond; RA, TA and proximity traffic are unaffected.

ABOVE line key - press to extend the upper limit of the protection window to +9900 ft. The lower limit stays at -2700 ft.

BELOW line key - press to extend the lower limit of the protection window to -9900 ft. The upper limit stays at +2700 ft.

(Continued)

AUTO - Sets the protection window limit to the normal ±2700 ft.
If AUTO is selected:
ABOVE will display when the aircraft climb rate is 300 fpm or greater for 5 seconds.
BELOW will display when the aircraft descent rate is 300 fpm or greater for 5 seconds.

Figure 10-2-1. DU TUNE PAGE - ATC1/TCAS Control Page

TCAS 1/4 WINDOW

The TCAS Only display is a heading-up, 360° representation that graphically depicts the relative bearing, range, altitude, and vertical direction of nearby transponder-equipped aircraft that reply to TCAS interrogations. The TCAS Only format is available for display on a Quarter MFW format.

TCAS information may be displayed on the HSI Map, MFW Map, and TCAS Only MFW formats. This section will describe the TCAS display on the TCAS Only MFW format. The TCAS Test, TCAS II traffic symbols, TCAS data tag, TCAS data block, and out of range traffic are displayed identically on the TCAS only MFW format to the HSI format. The TRAFFIC and NO ATT RA annunciations are not displayed on the TCAS Only MFW format.

Figure 10-2-2. TCAS 1/4 window Synoptic Display

TCAS II RESOLUTION ADVISORY DISPLAY

The color-coded visual advisory areas adjacent to the Vertical Speed Indicator's scale instructs the pilot to what vertical speed region is TO BE AVOIDED (red). If a change in vertical speed is necessary, the specific region of vertical speed is displayed in green. For example, if the corrective advisory message “Climb Climb, Climb” is annunciated, the prohibited red vertical speed region may extend from -6000 fpm to +1500 fpm. The green “fly-to” area appears from +1500 fpm to +2000 fpm.

A preventive resolution advisory is issued when the TCAS aircraft's present vertical speed is already outside the prohibited region. Those vertical speeds deemed unsafe are displayed in red. Preventive resolution advisory visual indications range from restricting rate of climb or descent, to prohibiting changes in vertical speed altogether. The message “Monitor Vertical Speed” accompanies the full range of preventive resolution advisories.

The TCAS pop-up feature allows graphical TCAS data to be automatically shown on the HSI when a TCAS TA or RA is detected. When the TCAS pop-up occurs, the 120° HSI format comes into view with a 5 nm half range and the Traffic overlay active, and WX overlay deselected. After a TCAS pop-up initially occurs, map controls for range selection and data selection are disabled. When a TCAS TA or RA is no longer active, the HSI automatically returns to the format, display range, and overlay states that existed before the pop-up occurred (this is referred to as pop-down).

TCAS MESSAGES

HSI/MFD map:

NO ATT RA (yellow) - A yellow NO ATT RA annunciation message is shown in the TCAS data block on the left side of the HSI if the TCAS vertical resolution advisory word cannot provide advisory information, or if pitch data is not being shown on the ADI.

Several TCAS system messages are displayed on the HSI Map and MFD Map.
Each of these messages is described below.

TCAS FAIL (Yellow) – A yellow TFC FAIL annunciation message is shown in the TCAS data block on the left side of the HSI if the TCAS system is failed. A TCAS that is turned off is considered failed. Failures related exclusively to the traffic display cause this message to be shown when the TCAS overlay is selected.

TRAFFIC - This message is displayed in red below the vertical speed scale on the PFD when the system detects RA traffic. This message is displayed in yellow below the vertical speed scale when the system detects TA traffic. If LANDING LIGHTS pushbutton is OFF, landing lights come on in PULSE mode at a rate of 45 times per minute.

TA ONLY - This message is displayed in white below the vertical speed scale on the PFD when the TCAS is operating in the TA ONLY mode. This message changes from white to yellow whenever TA intruders are detected.

TA/RA - This message is displayed in white. Normal system mode.

(Continued)

TCAS TEST - This message is displayed in white below the vertical speed scale on the PFD and in the center of the display on the MFD when the TCAS self-test is active. The self-test is selected via the RTU TCAS main display page.

TCAS OFF - This message is displayed in white below the vertical speed scale on the PFD when the TCAS system is in standby mode. Standby mode is selected via the CDU TCAS main display page. Standby mode is automatically selected when the ATC transponder mode is set to a mode other than ALT.

Supplement 3

BRAKE KINETIC ENERGY (BKE) AND BRAKE COOLING

GENERAL

The general information in the introduction section is applicable with the addition of the following:
To stop an aircraft in motion, the brakes along with other drag forces must be capable of dissipating the aircraft kinetic energy. The energy dissipated by the brakes accounts for most of this energy and generates heat, which is absorbed by the brakes and surrounding systems. High levels of heat may cause the fusible plugs in the wheels to release tire pressure to avoid system failure. Excessive heat can result in fire and damage.
This supplement provides the means to calculate brake cooling time required for safe operations.

SECTION I
LIMITATIONS

BRAKE KINETIC ENERGY (BKE) AND BRAKE COOLING

BKE LIMITS

The maximum BKE capacity of the G280 carbon brake system is certified for 50 million foot-pounds (MFP) and was demonstrated during rejected takeoff flight testing to be 54 million foot-pounds (MFP) – 1 MFP during taxi and 53MFP during RTO. The brakes must be inspected per equipment component maintenance manuals if a brake temperature exceeds 480°C as measured in the Brake Temperature Measuring System (BTMS) or when a blow out plug is triggered.

FUSE PLUG INTEGRITY ZONES

Each main wheel is equipped with fusible plugs, (subsequently referred to as fuseplugs). These fuseplugs are designed to melt to protect the tire from blowout in the event of excessive heat buildup during braking.
Three fuseplug integrity operating zones have been defined to indicate the likelihood of fuseplug release. These fuseplug integrity zones relate to the accumulated BKE levels absorbed during braking.
Appropriate actions in each zone are listed below:

NORMAL ZONE: Fuseplug release not likely; Brake temperature is below 450°C.
CAUTION ZONE: Fuseplug release is possible; Brake temperature is between 450°C and 480°C.
DANGER ZONE: Fuseplug release is probable; Brake temperature is above 480°C.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

No change.

SECTION IV
NORMAL PROCEDURES

No change.

BKE DETERMINATION DURING LANDING OR RTO OPERATIONS

The energy that can be absorbed by the brakes during a stop is determined by the previous energy absorbed, airplane gross weight, speed at brake application, taxi operations and the cooling conditions (OAT, Wind).

There are three ways to determine the required brakes cooling time prior to next departure:

1. **FMS calculation based on BTMS Peak Temperature and Takeoff PERF**
   Using the FMS BTMS Cool Time Remained value requires installation of VDB - MOD G25-20052.
2. **Manual calculation based on Brakes Peak Temperature**
   Using the BTMS Peak Temperature to determine Landing BKE and chart to find next Takeoff BKE. Then calculate required cooling time.
3. **Manual calculation based on Brake Kinetic Energy Estimation**
   Use of the Takeoff and Landing Brake Kinetic Energy Calculation chart (Figure 10-3-1) to determine BKE absorbed and possible cool-down time requires the operator to note the gross aircraft weight, initial brake application speed, landing altitude and ambient temperature.
   The Brake Kinetic Energy (BKE) presented in the BKE/Cooling chart is based on the aircraft total kinetic energy with no credit for aerodynamic drag or reverse thrust, as these components are most often offset by unequal energy distribution throughout the four (4) brake assemblies.
   This option should be used in case BTMS is invalid.

BRAKE COOLING FOR QUICK TURN-AROUND AND MULTIPLE BRAKING OPERATIONS

When planning quick turn-around operations, pilots must take into account the brake energy that will accumulate and the limited benefit of a short cooling period. A typical scenario would be a deadhead flight to pick up passengers for a subsequent intercontinental trip. The landing at the pickup point is at maximum landing weight with the subsequent takeoff at or near maximum takeoff weight. The resulting brake takeoff temperature becomes critical if a rejected takeoff is required. For the above scenario, the pilots must read the Peak Brake Temperature after full stop or track the cumulative energy inputs into the brakes which include braking on landing, brake inputs during taxi-in and taxi-out operations, and brake requirements in the event of a rejected takeoff. A cool-down period is required between the landing and the subsequent takeoff. The required cool-down time can be determined from either the FMS calculation or by a manual calculation.

TAXI BKE

BTMS Cooling time function is assuming a constant 3 statue miles taxi distance with no downhill slope.
Taxi brake kinetic energy should be calculated only for the second method using Manual calculation based on Speed on brakes for Landing BKE.

TAXI BKE MANUAL CALCULATION

Energy levels absorbed by the brakes during taxi operations are typically low. But, during long taxi operations, the energy absorbed from such sources as engine idle thrust, stops, and turns can be a factor. To account for these considerations, an estimate of brake energy requirements of 0.45 MFP per statute mile of taxi per brake is used (use Taxi distance correction chart).
This 0.45 MFP BKE is based upon a 20 knot taxi speed and one 20 knot stop per statute mile. In addition, the presence of taxiway slope (or runway slope when used to taxi) can add significantly to the brake energy absorbed during taxi. That is, for each statute mile of taxi on a downhill slope, an additional BKE contribution of 0.5 MFP per brake should be assumed to accumulate in the brakes for each 1% of downhill slope.
Reverse idle thrust can be used on an unlimited basis to control taxi speed and to stop the airplane during taxi operations, and accountability for the then negligible taxi BKEs will not be required.

USE OF FMS BTMS FUNCTION

FMS CALCULATION BASED ON BRAKES PEAK TEMPERATURE:
The BTMS provides information to the flight crew on the amount of time required for the aircraft brakes to have the capacity to absorb a RTO (Rejected takeoff).
The systems inputs are brakes peak temperature and Takeoff plan as entered into the FMS (Runway, slope, wind, OAT, TOW).

BTMS function can be enabled and disabled by the pilot. (CDU-PERF-TAKEOFF REF 2/5)
The BTMS function used the brakes peak temperature UTC from the EICAS (displayed on the brakes synoptic) and tabular data from the VDB (Vspeed Database) for planned takeoff to determine the cool down time in minutes.

It should be emphasized the Peak Brake Temperature should be read only 5 minutes after aircraft has completed its after landing taxi and arrived to a full stop.
Cooling time will not be displayed until a peak temperature is detected. PEAK TEMP NOT AVAIL amber CDU message will be displayed until peak detected and calculation performed.

If a cooling period is required – the display cool time remaining value will count down to zero in realtime. COOL DOWN TIME REQD amber CDU message is displayed. Vspeeds cannot be sent to display as long as the cooling time is not over.

If initial calculated cooling time was zero, hence, no cooling period required, it will display 0 and Vspeed can be sent to displays.
Cooling time will be recalculated if peak temperature is updated with a higher value (i.e. relocation of aircraft on the ramp using more brakes applications).

MANUAL CALCULATION BASED ON BRAKES PEAK TEMPERATURE:

Cooling time can be manually calculated based on brake peak temperature as a representation of the cumulative BKEs from previous operations and the estimated BKE for the next operation, including taxi.

The pilot will use BTMS Peak Temperature and Ambient Temperature to find the Landing brake energy and to then calculate the next Takeoff BKE.

Steps for using BTMS Peak temperature for Landing BKE:

- Enter Figure 10-3-2 at 0°C ambient temperature and at measured BTMS Peak Temperature.
- Correct for Ambient Temperature.
- Intersect with Landing Energy curve and get the Landing BKE (Per Brake) value.

Calculating next Takeoff BKE:

- Enter Figure 10-3-1:
- Use Planned Takeoff Weight as GWT.
- Use V1+8 KCAS as Brakes ON Speed.
- Correct for Pressure Altitude.
- Correct for Ambient temperature.
- Correct for Wind Component.
- Correct for TAXI Distance.
- Correct for TAXI Slope
  +0.5 MFP per 1% Downhill slope, per statute mile.

On Figure 10-3-2 (cooling time chart) intersect Resultant Landing energy and Resultant RTO energy values to get the required cooling time.

EXAMPLE 1:

BTMS Peak Temprature =	325°C
Airport Temperature =	30°C
Resultant Landing BKE per brake =	**7 MFP**
Takeoff Gross Weight =	37,000 lb
V1 Decision Speed =	122 KCAS
Takeoff Airport Elevation =	4,000 FT
Takeoff wind component =	10 kt Headwind
Takeoff Taxi Distance =	3 mile
Takeoff Taxi slope =	1% downhill
Resultant BKE per brake for RTO =	**10.4 MFP**

Solution:
Required cooling time is 24 minutes

MANUAL CALCULATION BASED ON BRAKE KINETIC ENERGY ESTIMATION

USE OF BKE COOLING CHART

This method for estimation of the braking system capabilities consists of calculating the remaining brake capacity using known history of prior operation and projected capability. The following example solutions will illustrate this method.

Calculating Landing BKE:

- Enter Figure 10-3-1 Use Landing Weight as GWT.
- If known, Use Landing Brakes ON Speed, otherwise use Vref as Brake ON Speed.
- Correct for Pressure Altitude.
- Correct for Ambient temperature.
- Correct for Wind Component.
- Correct for TAXI Distance.
- Correct for TAXI Slope
  +0.5 MFP per 1% Downhill slope, per statute mile.

Calculating next Takeoff BKE:

- Repeat steps for Landing BKE calculation
- Use Planned Takeoff Weight as GWT.
- Use V1+8 KCAS as Brakes ON Speed.

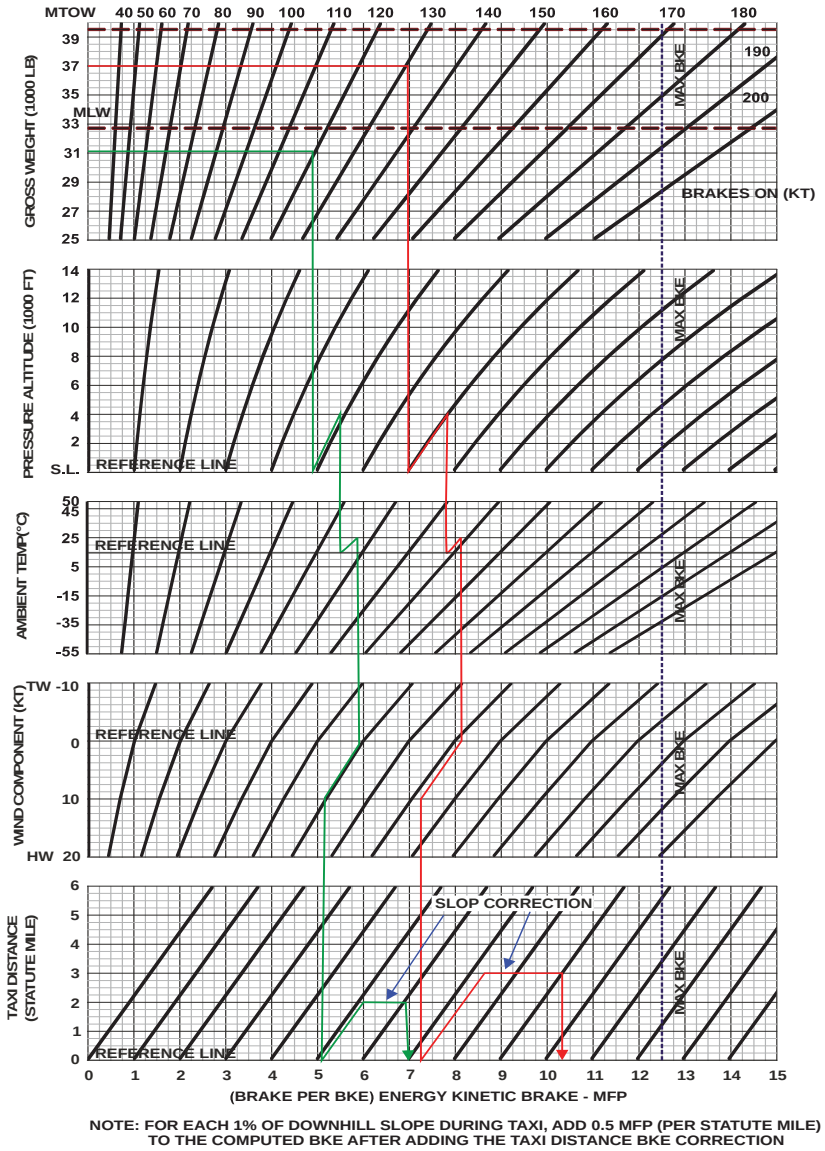
EXAMPLE 2:

Landing Gross Weight =	31,000 lb
Landing Speed =	120 KCAS
Landing Airport Temperature =	30°C
Landing Airport Elevation =	4,000 ft
Landing wind component =	10 kt Headwind
Landing Taxi Distance =	2 mile
Landing Taxi slope =	1% downhill
Resultant Landing BKE per brake =	**7.0 MFP**

Takeoff data same as Example 1.

Resultant BKE per brake for RTO =	**10.4 MFP**

Solution:
Required cooling time is 24 minutes



NOTE: FOR EACH 1% OF DOWNHILL SLOPE DURING TAXI, ADD 0.5 MFP (PER STATUTE MILE) TO THE COMPUTED BKE AFTER ADDING THE TAXI DISTANCE BKE CORRECTION

ROCKWELL COLLINS PRO LINE FUSION FMS FLIGHT MANAGEMENT SYSTEM

GENERAL

The general information in the introduction section is applicable with the addition of the following:

NAVIGATION APPROVAL STATUS

The Rockwell Collins Pro Line Fusion FMS multi-sensor navigation system supports compliance with AC 20-138D for IFR navigation using multi-sensor inputs including GNSS for en route, terminal area, and approach operations, provided it is receiving usable navigation signals, according to the applicable navigation specification.

For the purposes of FAA Performance Based Navigation Letter of Authorizations/Operations Specifications (PBN LOAs/OpsSpecs), the Rockwell Collins Pro Line Fusion FMS multi-sensor navigation system supports compliance with the following per FAA AC 90-105A (NOTE: this does not constitute operational approval):

B035 | En Route: RNP 2, RNAV 2, RNAV 5
B036, B054 | Oceanic / Remote / SAO: RNP 2, RNP 4, RNP 10
C052* | Approach: LNAV/VNAV, LNAV, LPV LPV, and Post MOD G25-10074 - LP.
C063** | Terminal: RNP 1 / RF / RNAV 1

*The G280 is not RNP Authorization Required (RNP AR) capable

**The G280 is not “Advanced RNP” capable as described in FAA AC 90-105A. The system does not allow manual scaling and alerting limits. However, the RNP value is automatically set based on the aircraft location in Oceanic, Enroute, Terminal or Approach airspace.

RNP RNAV Operations, listed in the following table, expands upon the above capabilities and provides additional specifications.

The navigation equipment as installed has been found to support compliance with the requirements for the following navigation specifications, provided it is receiving usable navigation signals.

GNSS Fault Detection and Exclusion (FDE) availability checks are not required within an area of SBAS coverage. If the FDE unavailability exceeds the acceptable duration of the specified route of flight, the flight must be canceled, delayed or re-routed as required for the specified area of operation and associated regulations. Collins Aerospace offers a Pre-Departure GPS Coverage Predictor Program, that is based on the logic of the installed GNSS units. The latest version of the program at the time of this publication is CPN 831-4894-012.

G280 - RNP RNAV Operations

Navigation Specification	Operations Requirements / Authorizations	Required Equipment	Reference Guidance
Oceanic and Remote Areas of Operation with GNSS (formerly Class II Navigation)	GNSS FDE availability must be verified prior to flight. Maximum predicted FDE unavailability is 51 minutes.	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors (see Loss of GNSS Information in System Failures for applicable indications). (or one FMS and one GNSS sensor for those routes requiring only one long range sensor).	Meets the applicable requirements of AC 20-138D AC 90-105A and AC 91-70A. This does not constitute an operational approval.
North and South Polar Areas	North Polar Area is the entire area north of N78° and South Polar Area is the entire area south of S60°. Usable signals from two AHRS and two Rockwell Collins GNSS sensors.	Two Super-AHRS or IRS units must be operating. Two FMS units must be operating and receiving usable signals from two Super-AHRS or IRS and two Rockwell Collins GNSS sensors. For routes approved for single GNSS navigation, a single FMS must be operating and receiving usable signals from the single GNSS.	Meets the applicable requirements of AC 20-138D AC 90-105A and AC 91-70A. This does not constitute an operational approval.
North Atlantic (NAT) High Level Airspace (HLA) (formerly Minimum Navigation Performance Specifications (MNPS))	GNSS FDE availability must be verified prior to flight. Maximum predicted FDE unavailability is 51 minutes.	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors (or one FMS and one GNSS sensor for those routes requiring only one long range sensor).	Meets the applicable requirements of AC 91-70A and NAT Doc 007. This does not constitute an operational approval.

(Continued)

Navigation Specification	Operations Requirements / Authorizations	Required Equipment	Reference Guidance
True Heading Procedures		True heading procedures are included in the navigation database.	
Enroute, Terminal and Approach Vertical Navigation	Use of Vertical Glidepath (VGP) guidance to a published DA is approved. VNAV operations using QFE altimeter settings are prohibited.	The selected navigation system is receiving usable information for a Baro-VNAV (or SBAS, if applicable) solution.	Meets the applicable requirements of AC 20-138D, AC 90-100A, AC 90-105, EASA AMC 20-27.
RNP APCH [titled RNAV (GPS) or RNAV (GNSS)] - including RNP procedures to a minimum value of RNP-0.3 (LNAV, LNAV/VNAV, LPV and Post MOD G25-10074 - LP minimums; see LPV APCH below for additional requirements when flying LPV APPR and Post MOD G25-10074 - LV APPR.	All instrument approaches that are retrieved from the navigation system database are authorized. GNSS is required to initiate RNAV(GPS) approach procedures. For RNAV(GPS) approach procedures, a missed approach is required if both GNSS sensors become unavailable. EPU does not exceed RNP (except during missed approach procedure following loss of GNSS navigation). Maximum predicted RAIM outage is 5 minutes. For ILS, LOC, LOC-BC, LOA, and SDF approach procedures, the active navigation source must be LOC or BC (green needles) prior to crossing the final approach fix). The GPS is not authorized to provide guidance for an approach that does not have a GPS overlay.	At least one FMS is receiving usable navigation information from a GNSS sensor (required for RNAV(GPS) approach procedures) and the RNP APPR annunciation must be displayed at the final approach fix. Preflight predictions for GNSS RAIM availability may be required by the local authority. Depending on database coding, the FMS may provide approach guidance (APPR) for some VOR approaches based on a VOR/DME or VORTAC (see RNAV (VOR/DME)" and "VOR/DME or RNAV(VOR) and VOR below).	ICAO Doc 9613, AC 20-138D, AMC 20-27 AC 90-105A AC 90-108. This does not constitute an operational approval.

(Continued)

Navigation Specification	Operations Requirements / Authorizations	Required Equipment	Reference Guidance
LPV APPR Post MOD G25-10074 - LP APPR	All instrument approaches that are retrieved from the navigation system database are authorized. GNSS is required to initiate RNAV(GPS) approach procedures. For RNAV(GPS) approach procedures, a missed approach is required if both GNSS sensors become unavailable. EPU does not exceed RNP (except during missed approach procedure following loss of GNSS navigation).	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors, and the LPV APPR annunciation must be displayed at the final approach fix. The associated charts do not indicate "Authorization Required".	AC 20-138D, AMC 20-28, AC 90-107. This does not constitute an operational approval.
RNAV (VOR/DME)" and "VOR/DME or RNAV(VOR) and VOR	FMS must be receiving the approach reference VOR/DME station.	GNSS sensors must be disabled in the FMS and the APPR annunciation must be displayed at the final approach fix.	AC 20-138D
Advanced RNP (A-RNP) for Radius to Fix (RF) Legs	RNAV or RNP Initial, Intermediate, and Missed approach segments of instrument approaches, for RNP Departures, RNP STARs and for RF Legs in RNAV or RNP Initial and Intermediate transitions to ILS	FMS is using GNSS and autopilot or flight director is coupled.	AC 20-138D This does not constitute approval to conduct RNP SAAAR or RNPAR instrument procedures.
RNAV-10 RNP-10	GNSS FDE availability must be verified prior to flight. Maximum predicted FDE unavailability is 34 minutes. EPU does not exceed RNP.	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors. ("FMS DR" is not displayed).	FAA Order 8400.128 AC 20-138D AC 90-105A AC 91-70A This does not constitute an operational approval.

(Continued)

Navigation Specification	Operations Requirements / Authorizations	Required Equipment	Reference Guidance
B-RNAV/RNAV-5 RNP-5	GNSS FDE availability must be verified prior to flight. Maximum predicted FDE unavailability is 5 minutes. EPU does not exceed RNP.	At least one FMS is receiving usable navigation information from one or more of the following sensors: Multiple DME receivers or a GNSS receiver.	ICAO Doc 7030/5 AC 20-138D AC 90-105A AC 91-70A AC 90-96A Change 1 for European B-RNAV This does not constitute an operational approval.
RNP-4 Oceanic and Remote Area Operations.	For the segment of route intended as RNP 4, the distance between consecutive waypoints does not exceed 800NM. GNSS FDE availability must be verified prior to flight. Maximum predicted FDE unavailability is 25 minutes. EPU does not exceed RNP.	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors. For RNP-4 operations, the FMS may be selected to RNP-4, such that the PFD will indicate 4 NM lateral deviation scaling and the limit annunciating "UNABLE RNP" will be 4 NM. Routes designated as RNP 4 may have additional requirements for communication. and surveillance.	AC 20-138D and ICAO Doc 9613 FAA AC 90-105A and AC 91-70A This does not constitute and operational approval.

(Continued)

Navigation Specification	Operations Requirements / Authorizations	Required Equipment	Reference Guidance
RNP-2 (Domestic and Offshore Operations)	For the segment of route intended as RNP 2, the distance between consecutive waypoints does not exceed 400NM. EPU does not exceed RNP.	At least one FMS is receiving usable navigation information from a GNSS sensor. Routes designated as RNP 4 may have additional requirements for communication.	AC 20-138D and ICAO Doc 9613 AC 90-105A and AC 91-70A This does not constitute and operational approval.
RNP-2 (Oceanic and Remote Continental Operations)	For the segment of route intended as RNP 2, the distance between consecutive waypoints does not exceed 400NM. EPU does not exceed RNP.	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors. Routes designated as RNP 4 may have additional requirements for communication.	AC 20-138D and ICAO Doc 9613 AC 90-105A and AC 91-70A This does not constitute and operational approval.
RNP-1	For the segment of route intended as RNP 1, the distance between consecutive waypoints does not exceed 200NM. GNSS FDE availability must be verified prior to flight for DPs that require GNSS. EPU does not exceed RNP.	Two FMS units must be operating and receiving usable navigation information from each of the dual GNSS sensors.	AC 20-138D ICAO Doc 9613 This does not constitute and operational approval.

(Continued)

Navigation Specification	Operations Requirements / Authorizations	Required Equipment	Reference Guidance
P-RNAV	GNSS is required for takeoff in P-RNAV airspace. GNSS FDE availability must be verified for the intended route of flight. EPU does not exceed RNP.	Determine the requirements of the national, area, or local air traffic control agency. Some terminal areas may require dual operating FMS and GPS equipment.	JAA TGL-10 AC 90-96A This does not constitute and operational approval.
RNAV-2 RNAV-1 RNAV Routes (Departure Procedures (DPs), Standard Terminal Arrivals (STARS), Q and T Routes)	GNSS FDE availability must be verified prior to flight for DPs that require GNSS. EPU does not exceed RNP.	At least one FMS is receiving usable navigation information from one or more of the following sensors: Multiple DME receivers or a GNSS receiver.	ICAO Doc 9613 and FAA AC 90-100A

Supplement 4

SECTION I
LIMITATIONS

SYSTEM LIMITATIONS

1. Normal operating procedures are outlined in the Rockwell Collins Pro Line Fusion FMS Pilot's Guide, Pro Line Fusion Flight Management System for the Gulfstream G280 must be immediately available to the flight crew at all time
   Pre MOD G25-10074: P/N 523-0822069-001117, First Edition, dated January 15, 2015 (or later applicable revision) with software program version 810-0162-1G0005;
   Post MOD G25-10074: P/N 523-0822069-002117, Second Edition, dated September 19, 2019 (or later applicable revision) with software program version 810-0162-1G0006 (or later).
2. All database numbers must be verified on CDU STATUS page 2, to be current and valid.
3. For IFR enroute and terminal navigation, verify that the database is current. If the database is out of date the pilot must verify each selected waypoint for accuracy and integrity by reference to current approved data. When flying in PRNAV airspace (RNP-1) pilots must verify the database is current and confirm the correct procedure has been selected. This process includes confirmation of waypoint sequence, reasonableness of track angles, distances, and any other parameters that can be altered by the pilot such as speed constraints. A navigational system textual display or navigation map must be used.

(Continued)

4. Instrument approaches must be accomplished in accordance with approved instrument approach procedures that are retrieved from the FMS equipment database. The FMS database must incorporate the current update cycle.
   a. FMS based instrument approaches (LPV, GPS/RNP) must be conducted in FMS approach mode (LPV APPR, RNP APPR indicated on the HSI), and GPS integrity monitoring (when using GPS for approach guidance) must be available at the final approach fix. FMS approach mode is not the Flight Controls Approach Mode. The Flight Control Approach Mode selected on the Flight Control Panel (FCP) can be APPR or LNAV to fly FMS approaches. VGP is only available when APPR and VNAV are selected. GPS can only be used for approach guidance if the reference coordinate datum system for the approach is WGS-84 or NAD-83.
5. The aircraft must have other approved navigation equipment installed and operating, appropriate to the route of flight.
6. Use of Rockwell Collins Pro Line Fusion FMS navigation data that is based solely on IRS input is prohibited while in terminal areas or during departures from or approaches to airports, or flight into valleys, e.g. between peaks in mountainous terrain or below Minimum Enroute Altitude (MEA).
7. When using VNAV, each pilot altimeter must be used as the primary altitude reference for all operations.
8. The fuel display parameters are advisory only and do not replace the primary fuel quantity or fuel flow gages for loading or range/reserve planning
9. Use of FMS lateral and vertical guidance between the Final Approach Fix and Missed Approach Point on ILS approaches is prohibited.
10. Use of FMS lateral guidance between the Final Approach Fix and Missed Approach Point on localizer or localizer back-course approaches is prohibited.

(Continued)

11. Adherence to published procedure altitudes is required when using FMS for advisory vertical guidance on localizer, localizer back-course or other non-precision instrument approaches, in accordance with FAA AC 120-108().
12. Do not use QFE altimeter setting for VNAV operations.
13. Flying approach procedures designated as RNP AR or "Authorization Required" is prohibited.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

SYSTEM FAILURES

System component failures are typically indicated by displaying a Crew Alerting System (CAS) message. The PFD, MAP and/or CDU may also display a MSG annunciation. Pressing the MSG key on the CDU displays the message page, indicating which component has failed. If a CDU goes blank, check the appropriate circuit breaker. If a CDU is inoperative, any operative CDU can be paired with any single operative FMS at a time.

Use other navigation systems (second FMS, VOR, DME, ADF) appropriate to the route of flight.

LOSS OF GNSS INFORMATION

Any of the following indications on any PFD or CDU indicate a loss of usable navigation information from the GNSS for the respective FMS:

- NO RNP
- UNABLE RNP
- FMS DR
- IRS ONLY
- V/D ONLY
- VOR/DME ONLY
- VOR/DME DIST > 40 NM
- GNSS NOT AVAILABLE
- GNSS FMS DISAGREE
- CHECK POS

POWER LOSSES

The Pro Line Fusion FMS's are installed without standby battery; power interruption to the Navigation Computer Unit blanks the display and causes the corresponding FMS flags to be displayed on the PFD (Primary Flight Display). As power supply resumes, Rockwell Collins Pro Line Fusion FMS displays time and position of power loss and duration of the power loss; afterwards, if duration of the power loss was less than 5 minutes, the system computes the approximate new position. The pilot should check this position and update the fuel display data.
.

NOTE

1. The data base, flight plans and waypoints are unaffected by power losses.
2. The fuel computation is also retained in non volatile memory. TAS, Altitude and entered fuel data are now crossfilled from one FMS to the other

FMS CAUTION MESSAGES

Yellow FMS messages require positive pilot action to correct navigation / approach accuracy problems.

All FMS annunciations (cautions and status) are outlined in Rockwell Collins Pro Line Fusion FMS Pilot's Guide, Flight Management System for the Gulfstream G280:
Pre MOD G25-10074: P/N 523-0822069-001117, First Edition, dated January 15, 2015, pages 12-5 through 12-49, (or later applicable revision) with software program version 810 -0162-1G0005;
Post MOD G25-10074: P/N 523-0822069-002117, Second Edition, dated September 19, 2019, pages 12-4 through 12-47 (or later applicable revision) with software program version 810-0162-1G0006 (or later).

SECTION IV
NORMAL PROCEDURES

Normal operating procedures are outlined in the Rockwell Collins Pro Line Fusion FMS Pilot's Guide, Flight Management System for the Gulfstream G280 must be immediately available to the flight crew at all time:
Pre MOD G25-10074: P/N 523-0822069-001117, First Edition, dated January 15, 2015 (or later applicable revision) with software program version 810-0162-1G0005;
Post MOD G25-10074: P/N 523-0822069-002117, Second Edition, dated September 19, 2019 (or later applicable revision) with software program version 810-0162-1G0006 (or later).

SYSTEM DESCRIPTION

FLIGHT DIRECTOR/AUTOPILOT INTERFACE

Rockwell Collins Pro Line Fusion FMS is brought into the active on-side navigation source by selecting NAV SOURCE on either side DCP, until FMS1 or FMS2 is displayed.
With valid leg selected on the coupled side, selecting LNAV on the FCP, FMS is displayed on the PFD.

AIR DATA COMPUTER INTERFACE

Dual ADC inputs to Rockwell Collins Pro Line Fusion FMS provide TAS, barometric and pressure altitudes, IAS and Mach number. No. 1 and No. 2 ADC's are connected to No. 1 and No. 2 FMS's, respectively. If an ADC fails, the cross-side ADC will be used as back up default.

PRO LINE FUSION FMS MESSAGES AND ANNUNCIATIONS

FMS message lines A1 and A2 appear in the upper right corner of the HSI just left of the NAV source information box. A third FMS message line, A3, appears on the HSI Map and Multifunction Window (MFW) Maps. The annunciations are shown if the FMS is the selected NAV source. The messages stay on while the condition causing them exists, or for a minimum of 5 seconds.

All FMS HSI annunciations (cautions and status) for G280 are outlined in Rockwell Collins Pro Line Fusion FMS Pilot's Guide, Flight Management System for the Gulfstream G280:

Pre MOD G25-10074: P/N 523-0822069-001117, First Edition, dated January 15, 2015, pages 12-50 through 12-57, (or later applicable revision).

Post MOD G25-10074: P/N 523-0822069-002117, Second Edition, dated September 19, 2019, pages 12-48 through 12-55(or later applicable revision)

PRO LINE FUSION FMS MESSAGES ON MAP MFW

All FMS MAP MFW messages for G280 are outlined in Rockwell Collins Pro Line Fusion FMS Pilot's Guide, Pro Line Fusion Flight Management System for the Gulfstream G280:

Pre MOD G25-10074: P/N 5523-0822069-001117, First Edition, dated January 15, 2015, pages 12-58 through 12-61, (or later applicable revision)

Post MOD G25-10074: P/N 523-0822069-002117, Second Edition, dated September 19, 2019, pages 12-56 through 12-59 (or later applicable revision)

TEMPORARY REVISION NO. 1

SUBJECT: ENGINE QUALITY ADDER PERFORMANCE CORRECTIONS FOR SUPPLEMENT 5 "FLAPS 0 PERFORMANCE"

PLEASE INSERT PAGES TR1-X-5-i THROUGH TR1-X-5-8 INTO YOUR AIRPLANE FLIGHT MANUAL IN FRONT OF SUPPLEMENT 5 UNTIL NEXT REVISION REPLACES THESE PAGES.

Affected pages: X-5-23 through X-5-79 and X-5-84, X-5-86 through X-5-142 and X-5-147

Supplement 5

ENGINE QUALITY ADDER PERFORMANCE CORRECTIONS

GENERAL

This supplement contains information on takeoff and landing performance correction for the G280 airplane.
The following corrections are to be applied when performing the specified performance calculations using the AFM and the FMS.
Correction charts are provided for the following performance parameters:

- TAKEOFF FIELD LENGTH (TOFL)
- TAKEOFF CLIMB GRADIENT - AVAILABLE 2nd SEGMENT CLIMB GRADIENT (GR2) AND FINAL SEGMENT CLIMB GRADIENT

These corrections cover all performance calculations available for section X-5 (Flaps 0° performance) and performance given for all abnormal procedures.

CAAI APPROVED
25 Oct 2016

TR1-X-5-1
Issue 1

USAGE OF TEMPORARY REVISION CORRECTION CHARTS

Calculating the corrected performance values using the following figures is performed in a similar manner for all correction charts.
Enter the correction chart with the calculated AFM/FMS performance value (figure X axis) and find corrected value (figure Y axis) at the intersection with the compatible correction line (see example on Figure TR1-X-5-1).

EXAMPLES

1. Determine the Takeoff field length required at the following runway conditions:
   - Gross Weight: 38,000 lb
   - Dry Runway
   - Flaps Setting: 0°
   - Pressure altitude: 1,000 ft
   - Ambient temperature: -5°C
   - Engine bleed setting: ECS-ON, Engine and Wing Anti-ice OFF
   - No Wind
   - Runway Slope: +2%

Result:
From Figure 10-5-6 we find an uncorrected TOFL of 7,680 ft.
Using Figure 5-99 no wind component correction is required, thus the corrected TOFL for the runway slope is 7,680 ft.
For ECS-ON correct the TOFL by 3%, the corrected TOFL is 7,910 ft.
Correct the TOFL using Figure TR1-X-5-2 and receive 8,200 ft.

2. For the same conditions as example 1, Determine the Available 2nd segment climb gradient:

Result:
From Figure 10-5-5 we find an uncorrected GR2 of 6.2%.
No wind component correction is required.
ECS-ON correction to GR2 of 0.6% leads to 5.6%
Correct GR2 using Figure TR1-X-5-3 and receive 5.35%.

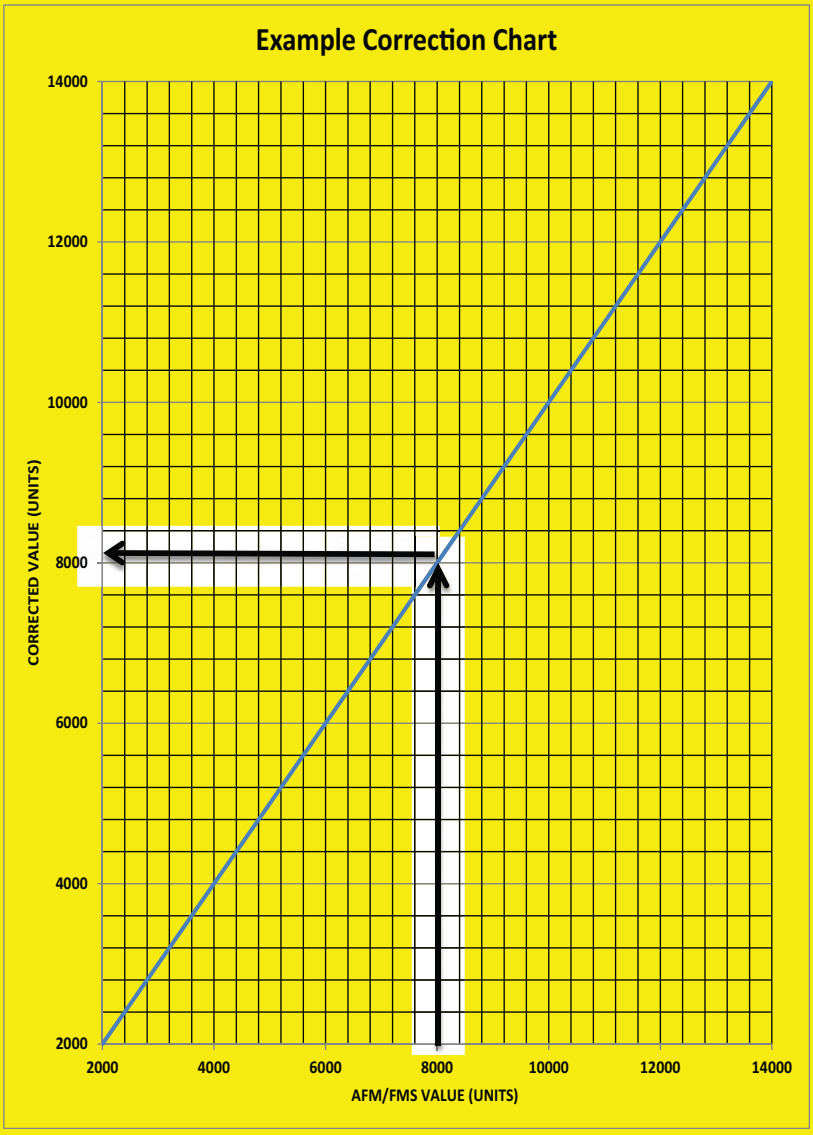

Figure TR1-X-5-1. Example Correction Chart

TAKEOFF FIELD LENGTH

Use Figure TR1-X-5-2 to correct the takeoff field length.

Figure TR1-X-5-2 presents correction lines applicable for takeoff on dry, wet and runways contaminated with compacted snow, ice or dry snow.
The correction charts contains correction lines for different runway slopes. These corrections are to be used in addition to the TOFL Runway slope correction charts presented in the AFM. First calculate the TOFL from the AFM/FMS including Wind component, Runway slope and Thrust reverser effect, and then apply the appropriate correction according to the existing runway slope.

Figure TR1-X-5-2 is applicable for:

Figure	Description	Page
10-5-5 through 10-5-19 and 10-5-21	TOFL FLAPS 0°; DRY RUNWAY ECS-OFF EAI-OFF WAI-OFF*	X-5-23 through X-5-79 and X-5-84
10-5-22 through 10-5-36 and 10-5-38	TOFL FLAPS 0°; WET RUNWAY ECS-OFF EAI-OFF WAI-OFF*	X-5-86 through X-5-142 and X-5-147

TAKEOFF CLIMB GRADIENTS

Use Figure TR1-X-5-3 to correct both the takeoff available 2nd segment climb gradient and the takeoff final segment climb gradient (same correction line applies for both parameters).
The correction chart is applicable to:

Figure	Description	Page
10-5-5 through 10-5-19 and 5-263	GR2; FLAPS 0°; DRY RUNWAY ECS-OFF EAI-OFF WAI-OFF*	X-5-23 through X-5-79 and V-755
10-5-22 through 10-5-36 and 5-263	GR2; FLAPS 0°; WET RUNWAY ECS-OFF EAI-OFF WAI-OFF*	X-5-86 through X-5-142 and V-755

* For flaps 0°, second segment gradient with engine bleed settings ECS-ON EAI-OFF WAI-OFF, ECS-ON EAI-ON WAI-ON or OFF, see instructions in Supplement 5: TAKEOFF CHARTS AND TABLES (X-5-12, X-5-13);
First apply the climb gradients reductions due to bleed, and after that apply the correction of Figure TR1-X-5-3.

Supplement 5

FLAPS - 0 PERFORMANCE

GENERAL

This supplement contains information for takeoff with flaps - 0° for the G280 airplane.
Takeoff in this configuration is allowed for dispatch only. Data is presented for dry and wet runway conditions.
This data complements the data contained within the basic Airplane Flight Manual (AFM). This supplement must therefore, be used in conjunction with the basic AFM.
Flight path planning for obstacle clearance should be conducted based on information provided in the basic AFM for Flaps 10°.

SECTION I
LIMITATIONS

Flaps - 0° takeoff is prohibited with any tailwind.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

No change.

SECTION IV
NORMAL PROCEDURES

No change.

MAXIMUM ALLOWABLE TAKEOFF WEIGHT

The maximum allowable takeoff weight (weight at brake release) is lowest value determined by each of following requirements:

1. Field length weight limitation.
2. Tire speed weight limitation.
3. Maximum brake energy weight limitation.
4. Maximum structural takeoff weight of 39,600 lb

NOTE

1. Maximum takeoff weight as permitted by climb gradient requirement is never a restricting factor, and therefore is not presented.
2. Maximum takeoff weight as permitted by obstacle clearance limitation should be established using information for flaps 10° presented in the basic AFM.

MAXIMUM TAKEOFF WEIGHT AS PERMITTED BY TIRE SPEED LIMITATIONS

Figure 10-5-3. presents the maximum allowable takeoff weight as permitted by the tire speed limitation. Correction for the reported wind is included.
The data is valid for both dry and wet runway conditions.

MAXIMUM TAKEOFF WEIGHT AS PERMITTED BY BRAKE ENERGY LIMITATIONS

Figure 10-5-4. presents the maximum allowable takeoff weight as limited by the maximum braking energy at a rejected takeoff. Corrections for the reported wind and runway gradient is included. The data is valid for all runway gradients from -2° to +2°.

TAKEOFF CHARTS AND TABLES

Takeoff data is provided for field elevations from sea level to 14,000 ft.
Each field elevation data has two tables as follows:
Part A - For OAT between -54°C and -5°C
Part B - For OAT between 0°C and 50°C
Pilot may interpolate performance values between adjacent elevation and temperature values.

Tables to determine V_1, V_R, V_2, second segment climb gradient (GR2) and takeoff field length (TOFL) for zero wind, zero runway gradient conditions:

Dry runways: Figure 10-5-5. through Figure Figure 10-5-19.
Wet runways: Figure 10-5-22. through Figure Figure 10-5-36.
The following figures are used to determine V_1, and takeoff field length. corrections for wind and runway slope:
For dry runways, use Figure Figure 10-5-20. for V_1 correction and Figure Figure 10-5-21. for takeoff field length correction.
For wet runways, use Figure Figure 10-5-37. V_1 correction and Figure Figure 10-5-38. for takeoff field length correction.

The data in the tables is presented for engine bleeds OFF.
For other engine bleed configurations use the following corrections:

For ECS ON, Engine AI OFF, Wing AI OFF:
Add 1 kt to V_1
Add 3% to takeoff field length
Reduce 2ND segment climb gradient by 0.6%

(Continued)

For ECS ON, Engine AI ON, Wing AI OFF or ON:
Add 2 knots to V_1
Add 6% to takeoff field length
Reduce 2ND segment climb gradient by 1.1%

Takeoff procedures are identical to those for normal takeoff flaps configurations defined in TAKEOFF PROCEDURES, page V-28.

HORIZONTAL STABILIZER TRIM SETTING

FOR TAKEOFF

Horizontal stabilizer trim setting for takeoff with flaps – 0° is defined in Figure 10-5-2 as a function of the aircraft zero-fuel longitudinal center of gravity location, fuel quantity and field pressure altitude.

DETERMINATION OF GROSS WEIGHT LONGITUDINAL CENTER OF GRAVITY LOCATION; FLAPS - 0°

Date: 15 Apr 2015 Manual No._____

GULFSTREAM AEROSPACE LP

Supplement 6

CATEGORY II OPERATIONS

GENERAL

This supplement is required for category II operation of the aircraft. It comprises the operation section of the category II manual.

Category II is a precision instrument approach and landing with a decision height lower than 60 m (200 ft) but not lower than 30 m (100 ft) and a runway visual range not less than 350 m (1200 ft).

The aircraft must have all required instruments and equipment installed and operative.

Approval of this supplement is effective only as the listed instruments and items of equipment are inspected and maintained in accordance with an approved maintenance program.

Compliance with this supplement does not constitute authorization to conduct category ii operations. Such authorization must be obtained by the operator from the appropriate authority.

The general information in the introduction section of the AFM is applicable with the addition of the following limitations:

SECTION I
LIMITATIONS

CATEGORY II LIMITATIONS

1. FCS-5000 autopilot and autothrottle system installed in the G280 aircraft complies with the relevant certification requirements of FAR 25, and EASA CS-25, JAR, and recommendations of FAA AC 120-29A, AC 91-16 and CS-AWO AMC-231, that pertain to the certification for coupled approaches to Category II minima.
2. Category II approaches shall be carried out only with:
   a. Both engines operating.
   b. Yaw damper engaged.
   c. Autopilot engaged
   d. Auto-throttles connected or disconnected.
3. CAT II shall be continued below 1000 AGL only when CAT2 green flag is annunciated on the ADI.
4. Landing from CAT II approach is approved with flaps in LND position only.
5. The autopilot is certified for CAAI/FAA and EASA Category II Minimum Use Heights (MUH) for precision approach of 80 ft AGL.
6. Demonstrated wind velocities:
   - Crosswind: 15 kt
   - Headwind: 21 kt
   - Tailwind: 10 kt

   The above winds were demonstrated during category II certification flight test and are not considered limitations.

(Continued)

7. Category II field lengths
   a. When auto brake systems are used for category II, information must be available to the flight crew to assist in making the proper selection of a suitable auto brake setting consistent with the field length available for landing and the runway condition, including braking action.
   b. Category II operations should not normally be conducted with braking action less than “fair” unless the operator has a method to ensure that timely updates of field conditions are provided to the flight crew, and, if applicable, also provided to the dispatcher, and that the flight crew considers that sufficient runway length is available.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

ENGINE FAILURE

After trimming and stabilizing the aircraft, continue approach, to category I landing minima. If engine failure occurs below 600 ft RA (Radar Altitude), perform go-around.

FLIGHT CONTROL SYSTEM OR INSTRUMENTS FAILURE

Go-around should be initiated during category II approach below 600 ft RA, if any of the following is annunciated:

- Yellow CAT2 annunciators flashes,
- Red standby ATT flag on ADI,
- Any EFIS comparator advisory,
- PFD/MFD failure on the flying pilot side or with any of the following red flags appearing on the PFD/MFD: ATT, FD, RA, LOC, GS, or HDG and there is no visual contact with runway or approach lights.

Go-around attitude is 9° to 17.5°

With RA higher than 600 ft, revert to category I landing minima.

AUTOPILOT DISENGAGED DURING APPROACH

Revert to category I landing minima.

CATEGORY II EXCESSIVE DEVIATION

The excessive localizer deviation appears as flashing at a standard flash rate LOC deviation pointer, and the pointer turns amber for the duration of the excessive deviation. The excessive glideslope deviation appears as flashing at a standard flash rate GS deviation pointer, and

the pointer turns amber for the duration of the excessive deviation). Excessive localizer and glideslope cues become active at 600 ft radio altitude; the localizer cue is active to touchdown and the glideslope cue is active to 90 ft radio altitude.

If IAS deviates by more than +10 kt or -5 kt from the set V_{REF}, a yellow flashing arrow appears adjacent to and above or below the IAS pointer (on the left side of the PFD), pointing to the direction of the required correction. The excessive IAS cue is active between 600 ft and 30 ft radio altitude.

SECTION IV
NORMAL PROCEDURES

CATEGORY II APPROACH PREPARATIONS

CAT 2 flag will be displayed when the following conditions are met:

- Left ADI active NAV source is LOC1 and right ADI active NAV Source is LOC2
- both sides LOC Frequencies are identical and valid
- Radio Altimeter is valid and Radio Height is below 1000 ft
- Not in BACK COURSE on the on-side PFD
- Neither FG is in GO-AROUND
- RA MIN is selected ON and RA MIN is below 200 ft

CATEGORY II APPROACH PREPARATION

1. ILS frequency..... SELECT ON BOTH NAV SOURCES
2. Compare attitude, air data and heading systems:
   a. Pitch and roll difference must not exceed 3°
   b. Heading difference must not exceed 6°
   c. Airspeed difference must not exceed 3 kt
   d. Altitude difference should not exceed 40 ft.
3. Course arrow ..... SET INBOUND COURSE
4. Marker switches .....ON
5. Plan localizer intercept prior to reaching outer marker

CATEGORY II APPROACH PROCEDURE

1. Decision Height (DH) .....SELECT (BELOW 200 ft)
2. APPR mode ..... SELECT

Observe LOC arm annunciator (white) on both PFD'S

3. Approach speed ..... V_{REF} + 10 KT
4. Normal landing checklist ..... COMPLETE
5. Intercept localizer and verify ILS capture;
   APPR LOC annunciator is green, GS (arm) is annunciated in white
6. Intercept glideslope and verify capture
   GS annunciators green
7. Airspeed ..... V_{REF} + 5 KT
8. Missed approach heading ..... SET
9. PFDs and MFDs .....NO FLAGS
10. CAT 2 annunciations ..... VERIFY GREEN, ON BOTH PFDS AT 1000 FT RA

NOTE

If amber CAT2 annunciator comes on discontinue Category II approach.
Below 600 ft RA - Go around.
Above 600 ft RA - continue to CAT 1 minima.

11. Autopilot ..... DISENGAGED, at 80 ft minimum

CATEGORY II EQUIPMENT

General

The EFIS system provides category II output, whenever DH of less than 200 ft is selected. To indicate when Category II approach monitoring requirements are not met, the output drives amber CAT2 annunciator near the flight mode annunciation field on the PFDs if one or more of the following conditions are true:

1. AHRS failure
2. ADC failure
3. RADALT failure
4. ILS failure
5. Flight director failure
6. DCP failure
7. AHRS reversion selected
8. ADC reversion selected
9. Roll comparator
10. Pitch comparator caution annunciation
11. HDG comparator caution annunciation
12. LOC comparator caution annunciation
13. G/S comparator caution annunciation
14. RA comparator caution annunciation
15. Back course condition exists
16. A/P not engaged
17. Onside APPR NAV source (LOC) not selected
18. NAV source not tuned the same
19. Selected course not the same
20. LOC not received
21. G/S not received
22. RADALT not received
23. G/S not captured

Supplement 6

CATEGORY II CHECKLIST DISPLAY

General

The PFDs can perform an automatic category II checklist. A CAT2 annunciator provides a “single glance” indication of whether the CAT2 Checklist is complete. The CAT2 Checklist provides a single line, prioritized, display of exception messages that indicate exceptions to the CAT 2 Checklist. The exceptions must be cleared in order to receive a green CAT2 annunciation.

Functional Description

Category II checklist are enabled when:
1. Approach Mode is armed or captured and
2. RA MIN is selected ON and RA MIN is below 200 ft and
3. Expanded localizer is enabled and
4. Radio altitude is higher than RA MIN and
5. The aircraft is weight off wheels and.
6. The cross-side PFD also declares all of the above are true.

The Category II (CAT2) annunciation shall be displayed near the Flight Mode Annunciation field when the CAT2 Checklist is enabled.

CAT2 **Annunciation:**

CAT2 is annunciated in green if the CAT2 checklist is enabled and no checklist exceptions exist and therefore no exception messages are being displayed on either PFD.
CAT2 is annunciated in amber above 200 ft AGL if the CAT2 checklist is enabled, checklist exceptions exist and corresponding exception messages are being displayed on either PFD, unless a red CAT2 annunciation exists on the other PFD.
CAT2 is annunciated in red below 200 ft AGL if the CAT2 checklist is enabled, checklist exceptions exist and corresponding exception messages are being displayed on either PFD

CAT2 Exception Messages:

CAT2 checklist exception messages are listed in the checklist exception messages table below.
CAT2 checklist exceptions are displayed as mutually exclusive exception messages presented in the priority listed.
CAT2 checklist exception messages are displayed in amber, in a message field below the altitude display on the ADI portion of the PFD. An exception is required to be cleared to go further down the checklist.

CATEGORY II CHECKLIST EXCEPTION MESSAGES

(Sheet 1 of 3)

Item	PFD Text
Either PFD's selected source for PITCH ANGLE, or ROLL ANGLE or AIRCRAFT HEADING: NCD, FAIL or missing	AHS FAILURE
On-side FD PITCH, FD ROLL, FGC MODE and/or Status Data: NCD, FAIL or missing	FD FAILURE
Either PFD's selected source for ALTITUDE or AIR SPEED: NCD, FAIL or missing	ADS FAILURE
ATTITUDE/HEADING REVERSION is common source	AHS REVERSION
AIR DATA REVERSION is common source	ADC REVERSION

CATEGORY II CHECKLIST EXCEPTION MESSAGES

(Sheet 2 of 3)

Left display NAV SOURCE not LOC1 or right display NAV SOURCE not LOC2	SEL APPR NAV
If LOC1/2 are the active NAV Sources: Either PFDs source for LOC DEVIATION: FAIL or missing OR Either PFDs source for GS DEVIATION: FAIL or missing	ILS FAILURE
NAV SOURCE LOC and both sides VOR/ILS FREQUENCY words not NORM or TEST or not identical	CHECK LOC TUNE
Left SELECTED COURSE not equal to RIGHT SELECTED COURSE	CHECK COURSE
Either PFD has BACK COURSE as the Active NAV Source	BACK COURSE
ATTITUDE Comparator Yellow Flag displayed	ATT COMPARATOR
ROLL Comparator Yellow Flag displayed	ROLL COMPARATOR
PITCH Comparator Yellow Flag displayed	PIT COMPARATOR
HEADING Comparator Yellow Flag displayed	HDG COMPARATOR
LOC DEV Comparator Yellow Flag displayed	LOC COMPARATOR
GS DEV Comparator Yellow Flag displayed	GS COMPARATOR
RA Comparator Yellow Flag displayed	RA COMPARATOR (Note: Not Applicable if single RAD ALT installed)
NAV SOURCE LOC and Left or Right LOC DEVIATION: NCD OR NAV SOURCE	LOC NOT VALID
NAV SOURCE LOC and Left or Right GS DEVIATION: NCD	GS NOT VALID
Flight Guidance steering commands are invalid	FD INVALID

CATEGORY II CHECKLIST EXCEPTION MESSAGES

(Sheet 3 of 3)

Flight Guidance is declaring that Glideslope is not captured	GS NOT CAPTURED
FLIGHT DIRECTOR Comparator Yellow Flag displayed	FD COMPARATOR
Single source flight director caution flag is displayed	FD NOT INDEP

EUROPEAN AVIATION SAFETY AGENCY
FLIGHT MANUAL SUPPLEMENT

This Airplane Flight Manual Supplement is approved by the Civil Aviation Authority, Israel (CAAI) on behalf of European Aviation Safety Agency (EASA) using the working arrangement between the Civil Aviation Authority, Israel and the European Aviation Safety Agency. This Airplane Flight Manual Supplement was prepared in accordance with European requirements.

This Supplement must be attached to the approved basic Gulfstream G280 Airplane Flight Manual Issue 1, dated April 15, 2015 for Gulfstream series G280 airplanes serial number (S/N) 2001 and subsequent, having European Aviation Safety Agency (EASA) certification.

The information contained herein supplements or supersedes the information of the basic Airplane Flight Manual. For Limitations, Normal Procedures, Abnormal Procedures, Emergency Procedures and Performance information not contained in this supplement, consult the basic Airplane Flight Manual.

EUROPEAN AVIATION SAFETY AGENCY FLIGHT MANUAL SUPPLEMENT

INTRODUCTION

GENERAL

Add the following:

Data provided in this supplement shall be attached to the GULFSTREAM G280 Airplane Flight Manual (AFM) Issue 1, for European Aviation Safety Agency (EASA) operations, and used in lieu of similar Civil Aviation Authority of Israel (CAAI) approved data presented in the basic Gulfstream G280 AFM latest released revision.

Operation in compliance with the Limitations presented in Section 1 of this Airplane Flight Manual is required by the European Aviation Safety Agency.

Use of Metric Values for Fuel-Related Displays (Option)

A. Fuel Quantity:
Fuel quantity displays have been modified to show fuel quantity in metric units. Kilograms (kg) are displayed instead of pounds (lb).

B. Fuel Flow:
Fuel flow displays have been modified to show fuel flow in metric units. Kilograms per hour (KGPH) are displayed instead of pounds per hour (PPH).

Flight Management System (FMS) (Option)

A. Multifunction Control Display Unit (MCDU) Data:
The FMS MCDU has been modified to display metric data consistent with the metric data used and displayed by other aircraft systems.

Supplement 7

SECTION I
LIMITATIONS

01-00-00: GENERAL

01-00-10: Conditions of Operations

Amend second paragraph to read:

THE PERFORMANCE LIMITATIONS AND INFORMATION PRESENTED IN THE AIRPLANE FLIGHT MANUAL SHOW COMPLIANCE WITH EUROPEAN AVIATION SAFETY AGENCY (EASA) REQUIREMENTS.

Add the following:

01-00-20: G280 Noise Standards (EASA)

The following noise levels comply with part 36, appendix B, Stage 5 maximum noise level requirements and were obtained by analysis of approved data from noise tests conducted under the provisions of part 36, Amendment 31. The noise measurement and evaluation procedures used to obtain these noise levels are considered by the FAA to be equivalent to the Chapter 14 noise levels required by the International Civil Aviation Organization (ICAO) in Annex 16, Volume 1, Aircraft Noise, Seventh Edition, July 2014, Amendment 11-B, applicable January 1, 2015.

The noise measurement and evaluation procedures used to obtain these noise levels are considered by the European Aviation Safety Agency (EASA) to be compliant with the Chapter 14 noise levels required by the International Civil Aviation Organization (ICAO) in Annex 16, Volume I, Eighth Edition.

The Effective Perceived Noise Levels (EPNL) for the Gulfstream G280 airplane equipped with Honeywell HTF7250G engines, at a maximum takeoff gross weight of 39,600 lbs and a maximum landing gross weight of 32,700 lbs are:

	Actual Noise Levels (EPNdB)
Lateral (Flaps 20°)	89.5
Flyover Lateral (Flaps 20°)	75.2
Approach Lateral (Flaps 39°)	90.5

No determination has been made by the European Aviation Safety Agency that the noise levels of this aircraft are or should be acceptable or unacceptable for operation at, into, or out of, any airport.

Supplement 7

01-03-00: PERFORMANCE

01-03-10: Types of Airplane Operations Permitted

Insert the following NOTE before item 1:

NOTE

Airworthiness approval for P-RNAV, MNPS, and RVSM does not authorize flight into airspace for which operational approval is required by ICAO Regional Navigational Agreement.

Revise item 14 to read:

14. RNAV Approach to Localizer Performance with Vertical Guidance (LPV) Minima

    With the limitations and exceptions defined in Section 01-34-60: Flight Management System (FMS).

GPS/SBAS Navigation System — SBAS Augmented GPS System Limitations:

The Gulfstream G280 has been evaluated and approved in accordance with, AMC 20-27, and AMC 20-28 with the following limitations:

- EGPWS must be operational when conducting LPV approaches

Add item 16 as follows:

16. VNAV system is approved for approach operations

    The VNAV system has been demonstrated capable of and has been shown to meet the accuracy requirements of: VFR/IFR en route, terminal, and approach BARO VNAV operation in accordance with the criteria of AC 20-129 and AMC 20-27.

NOTE

VNAV operations using QFE altimeter settings are prohibited.

01-03-10: Air Speed Limitations

Add the following statement under "LANDING GEAR OPERATION SPEEDS (V_{LO})":

V_{LO} is the maximum speed at which it is safe to extend or retract the landing gear.

Add the following statement under "LANDING GEAR EXTENDED SPEED (V_{LE})":

V_{LE} is the maximum speed at which the aeroplane can be safely flown with landing gear extended and locked.

01-21-20: INTERNAL BAGGAGE DOOR

Pre MOD G25-10066

Internal baggage door must be closed during taxi, takeoff and landing. In flight, access to the baggage compartment above 40,000 ft is prohibited except by flight crew members for emergency purposes only.

Post MOD G25-10066

Internal baggage door must be closed during taxi, takeoff and landing. In flight, access to the baggage compartment is permitted during cruise.

01-27-00: FLIGHT CONTROL SYSTEM (FCS)

Add the following:

01-27-30: Automatic Ground Spoilers

On dry runways takeoff is permitted with Automatic Ground Spoilers inoperative provided 10º or 20º flaps are used. Takeoff with Automatic Ground Spoilers inoperative is not permitted on contaminated runways under any circumstances.

01-27-50: Use of Flaps While Enroute

The use of flaps while “enroute” is prohibited. Per ACJ 25.345 (c), “Enroute includes holding in designated areas outside the terminal area of the airport and flight with flaps extended from top of descent.”

01-31-00: INDICATION AND RECORDING SYSTEMS

Add the following limitation:

01-31-40: Vertical Situation Display (VSD)

The use of the Vertical Situation Display during QFE operations is prohibited. The VSD has been demonstrated for terrain awareness only. The VSD shall not be used for navigation.

Add the following section and limitation:

01-32-00: LANDING GEAR

01-32-41: Main Tires

The use of the retreaded tires is prohibited.

1-34-60: FLIGHT MANAGEMENT SYSTEM (FMS)

Add new limitation
SBAS – LNAV/VNAV approaches

Use of SBAS to fly LNAV/VNAV approaches is prohibited.

Add following paragraph:
Instrument Approaches using FMS:

- The following instrument approach procedures may be flown using the FMS:
  - RNAV (GPS) using FAA approved approaches or RNAV (GNSS) using approaches approved outside FAA authority/influence.
  - GPS
  - VOR/DME RNAV
  - VOR/DME
  - VOR
  - TACAN
  - NDB

NOTE

If the approach is a non-GPS based RNAV approach, the procedure-based NAVAID must be monitored by one of the pilots during the approach.

Supplement 7

SECTION II
EMERGENCY PROCEDURES
No change.

SECTION III
ABNORMAL PROCEDURES

In the “CAUTION MESSAGES (AMBER)” table of Section IIIA make the following change:
In the “Corrective Action” column for the “WING TEMP LOW, L-R WING TEMP LOW, L WING TEMP LOW, R” message replace the “On ground” instructions with the following:

On ground:
1. Engine thrust.....INCREASE
2. Wing temperature..... MONITOR

If failure persists:
3. Do not dispatch

2. Replace existing message “Internal Baggage Door” with following:

Message	Triggered by	Corrective Action
Internal Baggage Door	Internal baggage door is open above 39,500 ft or below 9,500 ft, or, Aircraft on ground and one engine is running and parking brake is off	**PRE MOD G25-10066:** Verify baggage compartment unoccupied and close the door **POST MOD G25-10066:** 1. If the aircraft is below 9,500 feet verify baggage compartment unoccupied and close the door 2. If aircraft is above 40,000 minimize access to baggage compartment. Close the door when access completed. One flight crew to don oxygen mask

SECTION IV
NORMAL PROCEDURES

Before Takeoff

Add step 10 and NOTE to read:
10. Cockpit / Cabin Electrical Outlets..... NOT POWERED / NOT IN USE

Climb Transition

Add step 8 and NOTE to read:
8.Cockpit / Cabin Electrical Outlets .....AUTHORIZED FOR USE

Before Landing

Add step 7 and NOTE to read:
7. Cockpit / Cabin Electrical Outlets.....NOT POWERED / NOT IN USE

Supplement 7

BARO VNAV Operations

RNAV (GPS/GNSS) APPROACH PROCEDURE TO LNAV/VNAV MINIMUMS

1. Published approach .....REVIEW
2. Approach.....SELECT FROM DATA BASE AND EXECUTE
3. FMS - ARRIVAL DATA..... REVIEW APPR MODE, RNP AND GP
4. GP (Glide Path) Mode.....SELECT BARO
5. BARO minima .....SET
6. FMS.....VERIFY IN SYNC MODE
7. NAV Source.....EACH SIDE HAS ON SIDE FMS SELECTED
8. Verify that RNP values switch from 2 NM to 1 NM approximately 30 nm from airport.
9. When cleared for the approach, arm the APPR and VNAV mode on the FCP and set the altitude preselector to the appropriate altitude.
10. When within 2 nm of the FAF (Final Approach Fix), RNP APPR will be displayed on the PFD. This is confirmation the approach can be continued to the established minimums.
    If RNP APPR does not display, the approach shall be abandoned.
11. Verify RWY is annunciated when within 500 ft (approx 2 dots) of the glide path.
12. Verify VGP is annunciated in green in the FMA on each PFD after glide path capture.

<<END>>

SECTION V
PERFORMANCE WET AND DRY

DEFINITIONS

Distances

Replace the existing definition of "Dry Runway" with the following:

Dry Runway - Runways which are not "Wet" or "Contaminated" according to the definitions contained in EU-OPS 1.

FINAL APPROACH AND LANDING PERFORMANCE

Operating Rules for Commercial Operators

Replace the entire section with the following:

The following operating rule applies to all commercial operators required to observe the regulations of EUIR-OPS.CAT and IR-OPS.NCC

1. Intended Destination and Alternate, Dry: No airplane shall takeoff at weight in excess of that which, in accordance with landing distances shown in the Operations Manual for the airport elevation and for wind conditions anticipated there at the time of landing, would allow full stop landing within 60% of the effective length of the runway from a point 50 feet directly above the intersection of obstruction clearance plane and the runway.

2. Intended Destination and Alternate, Wet: No airplane shall takeoff when appropriate weather reports and forecasts, or a combination thereof, indicate that runways may be wet or slippery at the estimated time of arrival unless the landing distance available for the wet or slippery runway at the intended and alternate destinations is at least 115% of the respective dry runway length at each destination as determined per the guidance in paragraph 1 above.
   Note that wet runway distances are valid only for 0.125 in (3 mm) or less of standing water.

LANDING FIELD LENGTH OPERATIONAL FACTOR

CORRECTIONS

Figure 5-284 - Landing Field Length Operational Factor Corrections

In the annotations on the graph, in two locations replace the reference to “PART 121 AND 135” with “IR-OPS.CAT.POL.A.” for the DRY RUNWAY dotted line and with “IR-OPS.CAT.POL.A.235” for the WET RUNWAY dotted line.

TAKE OFF FIELD LENGTH CORRECTIONS WITH AUTOMATIC GROUND SPOILER SYSTEM INOPERATIVE

With CAS message GND Spoiler Auto Fail On apply the following corrections to calculated take off distances.
Correction Factors apply for take off. Apply whichever is greater:

Runway Cond.	MAN Spoiler Factor
DRY	+7%
WET	600 FT or 14%
COMPACT SNOW	700 FT or 12%
ICE	1000 FT or 15%
Standing water SLUSH or WET SNOW	500 FT or 7%
DRY SNOW	500 FT or 8%
Add the Greater Correction of X ft or Y %

LANDING PERFORMANCE X-8-46

CROSSWIND LIMITATIONS FOR OPERATIONS ON CONTAMINATED RUNWAYS X-8-50

10-8-1 Runway Surface Contaminated (RSC) & CRFI Equivalent X-8-51

10-8-2 Canadian Runway Friction Index (CRFI) Crosswind Limits X-8-52

UNITS CONVERSION X-8-53

TAKE-OFF DISTANCE - FLAPS 20° X-8-54

10-8-3 TAKE-OFF DATA; FLAPS - 20°; SEA LEVEL ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-55

10-8-4 TAKE-OFF DATA; FLAPS - 20°; SEA LEVEL ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART B; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-57

10-8-5 TAKE-OFF DATA; FLAPS - 20°; 1000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-59

10-8-6 TAKE-OFF DATA; FLAPS - 20°; 1000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART B; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-61

10-8-7 TAKE-OFF DATA; FLAPS - 20°; 2000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-63

10-8-8 TAKE-OFF DATA; FLAPS - 20°; 2000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART B; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-65

10-8-9 TAKE-OFF DATA; FLAPS - 20°; 3000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-67

10-8-10 TAKE-OFF DATA; FLAPS - 20°; 3000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART B; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-69

10-8-11 TAKE-OFF DATA; FLAPS - 20°; 4000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-71

10-8-12 TAKE-OFF DATA; FLAPS - 20°; 4000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART B; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-73

10-8-13 TAKE-OFF DATA; FLAPS - 20°; 5000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-75

10-8-14 TAKE-OFF DATA; FLAPS - 20°; 5000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART B; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-77

10-8-15 TAKE-OFF DATA; FLAPS - 20°; 6000 FT ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF PART A; RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-79

10-8-16 TAKE-OFF DATA; FLAPS - 20°; 6000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-81

10-8-17 TAKE-OFF DATA; FLAPS - 20°; 7000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-83

10-8-18 TAKE-OFF DATA; FLAPS - 20°; 7000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-85

10-8-19 TAKE-OFF DATA; FLAPS - 20°; 8000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-87

10-8-20 TAKE-OFF DATA; FLAPS - 20°; 8000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-89

10-8-21 TAKE-OFF DATA; FLAPS - 20°; 9000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-91

10-8-22 TAKE-OFF DATA; FLAPS - 20°; 9000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-93

10-8-23 TAKE-OFF DATA; FLAPS - 20°; 10000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-95

10-8-24 TAKE-OFF DATA; FLAPS - 20°; 10000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-97

10-8-25 TAKE-OFF DATA; FLAPS - 20°; 11000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-99

10-8-26 TAKE-OFF DATA; FLAPS - 20°; 11000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-101

10-8-27 TAKE-OFF DATA; FLAPS - 20°; 12000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-103

10-8-28 TAKE-OFF DATA; FLAPS - 20°; 12000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-105

10-8-29 TAKE-OFF DATA; FLAPS - 20°; 13000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-107

10-8-30 TAKE-OFF DATA; FLAPS - 20°; 13000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-109

10-8-31 TAKE-OFF DATA; FLAPS - 20°; 14000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART A; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-111

10-8-32 TAKE-OFF DATA; FLAPS - 20°; 14000 FT
ECS - ON; ENGINE ANTI-ICE - OFF; WING ANTI-ICE - OFF
PART B; RUNWAY CONTAMINATED BY SLUSH OR
STANDING WATER OR WET SNOW X-8-113

10-8-33 TAKE-OFF DATA; FLAPS - 20°; SEA LEVEL
ECS - ON; ENGINE ANTI-ICE - ON;
WING ANTI-ICE - ON OR OFF
RUNWAY CONTAMINATED BY SLUSH
OR STANDING WATER OR WET SNOW..... X-8-115

10-8-34 TAKE-OFF DATA; FLAPS - 20°; 1000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-117

10-8-35 TAKE-OFF DATA; FLAPS - 20°; 2000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-119

10-8-36 TAKE-OFF DATA; FLAPS - 20°; 3000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-121

10-8-37 TAKE-OFF DATA; FLAPS - 20°; 4000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-123

10-8-38 TAKE-OFF DATA; FLAPS - 20°; 5000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-125

10-8-39 TAKE-OFF DATA; FLAPS - 20°; 6000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-127

10-8-40 TAKE-OFF DATA; FLAPS - 20°; 7000 FT ECS - ON; ENGINE ANTI-ICE - ON; WING ANTI-ICE - ON OR OFF RUNWAY CONTAMINATED BY SLUSH OR STANDING WATER OR WET SNOW X-8-129

10-8-41 TAKE-OFF DATA; FLAPS - 20°; 8000 FT
ECS - ON; ENGINE ANTI-ICE - ON;
WING ANTI-ICE - ON OR OFF
RUNWAY CONTAMINATED BY SLUSH
OR STANDING WATER OR WET SNOW..... X-8-131

10-8-42 TAKE-OFF DATA; FLAPS - 20°; 9000 FT
ECS - ON; ENGINE ANTI-ICE - ON;
WING ANTI-ICE - ON OR OFF
RUNWAY CONTAMINATED BY SLUSH
OR STANDING WATER OR WET SNOW..... X-8-133

CONTAMINATED RUNWAY OPERATIONS

INTRODUCTION

GENERAL

The general information in the introduction section of the basic AFM is applicable with the addition of the following:

The information in this supplement has been prepared by the manufacturer and approved as guidance material, to assist operators in developing suitable guidance, recommendations or instructions for use by their flight crews when operating on contaminated runway surface conditions.

The data in this supplement are not based on flight test data, but rather based on analytical guidance material prescribed by EASA (European Aviation Safety Agency).

The performance information assumes any slush, standing water or wet snow to be of uniform depth and density.

The level of safety is decreased when operating on contaminated runways and therefore every effort should be made to ensure that the runway surface is cleared of any significant contaminate.

The provision of performance information for contaminated runways should not be taken as implying that ground handling characteristics on these surfaces will be as good as can be achieved on dry or wet runways, in particular, in cross-winds and when using reverse thrust.

CONTAMINATED RUNWAY LIMITATIONS

The limitations in Section I are applicable with the addition of the following:

The following material does not address multiple contaminant types such as wet snow covering compacted snow or slush covering an icy runway. Pilots should be especially cautious about conducting take-off and landing operations when multiple contaminant types are present.

Airport operations on wet snow and slush-covered runways are treated in a similar manner as operations on a runway contaminated with standing water.

The maximum depth of runway contaminants covering an appreciable part of the runway are:

Contaminant	**Maximum Contaminant Depth**
Standing Water	6.4 mm / 0.25 in
Slush	7.4 mm / 0.29 in
Wet Snow	12.7 mm / 0.5 in
Dry Snow	30 mm / 1.18 in

SECTION II
EMERGENCY PROCEDURES
No change.

SECTION III
ABNORMAL PROCEDURES
No change.

SECTION IV
NORMAL PROCEDURES
No change.

SECTION V
PERFORMANCE

DEFINITIONS

The performance data in section V and compatible supplements are applicable with the addition of the following:

Runway contaminated by slush, standing water or wet snow - A runway is considered to be contaminated when more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used, is covered by surface water, more than 3 mm (0.125 inch) of standing water, or by slush or wet snow, equivalent to more than 3 mm (0.125 inch) of water.

Runway contaminated by dry snow - A runway is to be considered contaminated by dry snow when covered by fresh snow which can be blown, or if compacted by hand, will fall apart upon release.

Runway contaminated by compacted snow - A runway is to be considered contaminated by compacted snow when covered by snow which has been compacted into a solid mass which resists further compression.

Runway contaminated by Ice - A runway is considered to be contaminated by ice when braking action is expected to be very low, due to the presence of ice.

Equivalent Water Depth

Airport operations on loose wet snow and slush-covered runways are treated in a similar manner as operations on a runway contaminated with standing water. The only difference is due to different densities of the contaminant. A measurable depth of loose wet snow (50% the density of water) or slush (85% the density of water) may be converted to an equivalent depth of standing as follows:

Standing Water Depth	Slush Depth	Loose Wet Snow Depth
3.0 mm / 0.12 in	3.5 mm / 0.14 in	6.0 mm / 0.24 in
6.4 mm / 0.25 in	7.4 mm / 0.29 in	12.7 mm / 0.5 in

PERFORMANCE

TAKE-OFF PERFORMANCE

Distances for runways contaminated with standing water, slush, wet snow, dry snow, compacted snow and ice have been calculated assuming that the runway is completely contaminated.

All contaminated runway takeoff performance is based on the following performance conditions:

Braking	–	Maximum until full stop
APR	–	NOT INHIBITED
Ground Spoilers	–	NOT INHIBITED
Thrust Reversers	–	Maximum Reverse down to 40 KIAS, then set to Reverse Idle until full stop.

Contaminated runway charts are provided for the following runway conditions:

Standing water, slush and wet snow
Dry Snow
Compacted snow
Ice

The determination of the takeoff field length and of the takeoff speeds on a contaminated runway must follow the same procedure as described in the section V of the AFM for dry and wet runway.
The contaminated runway charts are presented for the flap 10° and 20° configurations. The presented contaminated runway takeoff data is based on the use of thrust reversers for rejected takeoff.

(Continued)

Takeoff performance data are provided for the following engine bleed configurations:
1. ECS bleed on, engine anti-ice and wing anti-ice off
2. ECS bleed on, engine anti-ice on and wing anti-ice on or off.

For configuration: ECS bleed off, engine anti-ice and wing anti-ice off, use performance data from configuration 1.
For configuration: ECS bleed and wing anti-ice off, engine anti-ice on, use performance data from configuration 2.

The takeoff performance data are shown in terms of airport pressure altitude, surface temperature, and aircraft weight. Correction charts are included for the effect of runway slope, reported wind, and availability of thrust reversers at dispatch.
For dispatch with one or both thrust reverser inoperative, use the included corrections for V1 and TOFL.

NOTE

Operations on an icy runway require a minimum of one operational thrust reverser. In the case of dispatch with one thrust reverser inoperative, if the engine with an operating thrust reverser fails, no thrust reverser is available for rejected takeoff. Therefore dispatch with one or both thrust reversers inoperative on an icy runway is prohibited.

Take-Off Charts

The following charts should be used to determine V1, VR, V2, second segment climb gradient (GR2) and takeoff field length (TOFL):

Flaps - 20°

	Zero Wind and Runway Slope	V1 Correction	TOFL Correction
Runway Contaminated by Slush or Standing Water or Wet Snow	10-8-3 through 10-8-47	10-8-48	10-8-49
Runway Contaminated by Dry Snow	10-8-50 through 10-8-94	10-8-95	10-8-96
Runway Contaminated by Compacted Snow	10-8-97 through 10-8-141	10-8-142	10-8-143
Runway Contaminated by Ice	10-8-144 through 10-8-188	10-8-189	10-8-190

Flaps - 10°

	Zero Wind and Runway Slope	V1 Correction	TOFL Correction
Runway Contaminated by Slush or Standing Water or Wet Snow	10-8-191 through 10-8-234	10-8-235	10-8-236
Runway Contaminated by Dry Snow	10-8-237 through 10-8-281	10-8-282	10-8-283
Runway Contaminated by Compacted Snow	10-8-284 through 10-8-328	10-8-329	10-8-330
Runway Contaminated by Ice	10-8-331 through 10-8-375	10-8-376	10-8-377

(Continued)

Example:

Define the takeoff data for the following conditions:
Weight: 38000 Lb
Flaps - 20°
Airport pressure altitude: 2,000 ft
Ambient temperature: 0°C
ECS: ON
Engine Anti-ice: ON
Wing Anti-ice: ON
Wind: 10 knots (headwind)
Runway condition: Compacted Snow
Runway slope: +1% (uphill)

1. From Figure 10-8-129 determine the takeoff data for zero wind and zero runway slope:

   TOFL = 5210 Ft
   V1 = 108 KIAS
   VR = 127 KIAS
   V2 = 135 KIAS

2. From Figure 10-8-142 and figure 10-8-143 determine the V1 and TOFL corrected for the reported wind and runway slope:

   V1 = 113 KIAS
   TOFL = 5400 Ft

LANDING PERFORMANCE

This Supplement includes charts to obtain the actual landing distance on a contaminated runway for the following contaminants:

Standing water, slush and wet snow
Dry Snow
Compacted snow
Ice

Landing Limitations

The following limitations apply to landing operations on contaminated runways:

1. Flap setting - 39 degrees.
2. Maximum Contaminant Depth, see table on page X-8-39.
3. All AFM limitations apply.
4. Anti-skid Operative.

While these limitations must be observed, additional data for overweight and abnormal flaps landings have been provided for reference in emergency situations.

(Continued)

Landing Procedures

The landing distances provided in this supplement are based on the following procedure:

- V_{REF} is established by 50 feet above the runway.
- Ground spoiler deployment is initiated automatically when the WOW signal is active and the engine throttles are at Idle.
- Immediately after touchdown, the nose is lowered, brakes are applied, reversers are deployed and the power levers are moved to the maximum reverse thrust position.
- Maximum braking is maintained until the aircraft comes to a complete stop.
- At 40 KCAS, power levers are reduced to reverse idle, and the reverse idle thrust is maintained until the aircraft comes to a complete stop (reverser doors remain deployed).

NOTE

1. Credit on landing distance on contaminated runways is taken for one thrust reverser operating. Correction factors are provided for the case when both thrust reversers are inoperative.
2. For runways contaminated with standing water/slush/wet snow or dry snow, landing performance data were based on the minimum contaminant depth (0.125 inch/3 mm of standing water or 0.04 inch/1 mm of dry snow), with correspondingly lower contaminant drag, thus providing longer landing distances.

(Continued)

Landing Charts

The following charts should be used to determine the final approach speed (VAPP), the reference landing speed (VREF) and the actual landing distance (ALD) for different types of runway contaminants:

Flaps 39°

Runway Contaminated by:	Zero Wind Conditions	Wind Correction
Slush or Standing Water or Wet Snow	10-8-378	10-8-379
Dry Snow	10-8-380	10-8-381
Compacted Snow	10-8-382	10-8-383
Ice	10-8-384	10-8-385

Flaps 20°

Runway Contaminated by:	Zero Wind Conditions	Wind Correction
Slush or Standing Water or Wet Snow	10-8-386	10-8-387
Dry Snow	10-8-388	10-8-389
Compacted Snow	10-8-390	10-8-391
Ice	10-8-392	10-8-393

Flaps 10°

Runway Contaminated by:	Zero Wind Conditions	Wind Correction
Slush or Standing Water or Wet Snow	10-8-394	10-8-395
Dry Snow	10-8-396	10-8-397
Compacted Snow	10-8-398	10-8-399
Ice	10-8-400	10-8-401

Flaps 0°

Runway Contaminated by:	Zero Wind Conditions	Wind Correction
Slush or Standing Water or Wet Snow	10-8-402	10-8-403
Dry Snow	10-8-404	10-8-405
Compacted Snow	10-8-406	10-8-407
Ice	10-8-408	10-8-409

(Continued)

Correction for the effect of inoperative thrust reversers

The presented contaminated actual landing distances assume one thrust reverser is operational.
If both thrust reversers are inoperative, the presented actual landing distance should be increased, depending on the flap configuration, by the following factors:

Contaminant	Flap 39°	Flaps 20°, 10° or 0°
Standing water, slush and wet snow	1.13	1.17
Dry Snow	1.12	1.15
Compacted Snow	1.10	1.12
Ice	2.0	2.0

Correction for the effect of ambient temperature

The presented contaminated actual landing distances are based on ISA conditions.
Applicable regulations do not require actual landing distance to be corrected for temperature effects. If required, the operator may use the following ALD temperature corrections:

Increase ALD by 4.5% for every 10°C above ISA.
Decrease ALD by 3% for every 10°C below ISA.

ALD Runway Slope Corrections:

Increase dry ALD by 16% for every 1% DOWNHILL runway slope.
Decrease dry ALD by 5% for every 1% UPHILL runway slope.

CROSSWIND LIMITATIONS FOR OPERATIONS ON CONTAMINATED RUNWAYS

Crosswind capabilities for takeoffs and landings on wet or contaminated runways may be reduced relative to demonstrated crosswind capabilities on dry runways. For the G280, the maximum crosswind demonstrated on a dry runway was 25 knots. It should be noted that this is not a dry runway limit, but rather a maximum demonstrated value. Although Gulfstream has not conducted dedicated flight testing to determine crosswind capabilities for wet and contaminated runways, Transport Canada has published a generic chart that can be used to determine crosswind capabilities as a function of the runway surface condition. To use this chart, it is first necessary to enter table on page X-8-51 to determine the Canadian Runway Friction Index (CRFI) corresponding to a given contaminant type.

Once the CRFI has been identified, the crosswind chart (Figure 10-8-2.) can be entered at this CRFI value to determine an allowable crosswind component.
Note that the CFRI scale at the bottom of this chart has different scale intervals between 0.3 and 0.4 and between 0.6 and 0.7 when compared to the scale intervals on the rest of the CRFI scale.
This is by design and not an error.

The following example illustrates how to determine the allowable crosswind limit when taking off or landing on a runway covered by snow. Using table on page X-8-51, the CRFI range for a snow-covered runway is between 0.25 and 0.30. From Figure 10-8-2., the corresponding crosswind limit for this CRFI range is 5 to 10 knots.

Runway Surface Contamination	CRFI Equivalent
Bare and Dry	≥ 0.80
Damp – Less than 0.01 inch of water	0.60 – 0.70
Very light snow patches	0.55 – 0.60
Wet concrete – 0.01 to 0.03 inch of water	0.40 – 0.55
Wet Asphalt – 0.01 to 0.03 inch of water	0.30 – 0.60
Compacted snow – below – 15°C	0.40
Sanded, packed snow or ice	0.40 – 0.50
Heavy rain – 0.03 to 0.10 inch of water	0.28 – 0.30
Snow covered	0.25 – 0.30
Compacted snow – above -15°C	0.20 – 0.25
Cold ice – below – 10°C	0.10 – 0.20
Wet ice – above -10°C	0.05 -0.10
Hydroplaning – standing water ≥ 0.10	0.05
