TRANSPORT CANADA CIVIL AVIATION APPROVED AIRPLANE FLIGHT MANUAL SUPPLEMENT No. 9 for GULFSTREAM G280 AIRPLANE

MFR SERIAL No. _____

REGISTRATION No. _____

TRANSPORT CANADA CIVIL AVIATION FLIGHT MANUAL SUPPLEMENT

This Airplane Flight Manual Supplement is approved by Transport Canada Civil Aviation (TCCA).

This Supplement must be attached to the approved basic Gulfstream G280 Airplane Flight Manual, dated August 26, 2012, or later approved revisions, for Gulfstream series G280 airplanes serial number (S/N) 2001 and subsequent, operated under Canadian registry.

The information contained herein supplements or supersedes the information of the basic Airplane Flight Manual. For Limitations, Normal Procedures, Abnormal Procedures, Emergency Procedures and Performance information not contained in this supplement, consult the basic Airplane Flight Manual.

TCCA APPROVED: 
Chief, Flight Test
for Director, National Aircraft Certification
TRANSPORT CANADA

Date: 9/4/2013 Manual No.....
GULFSTREAM AEROSPACE LP.

TCCA APPROVED
28 Mar 2013

TRANSPORT CANADA CIVIL AVIATION FLIGHT MANUAL SUPPLEMENT

INTRODUCTION

GENERAL

Add the following:

Data provided in this supplement shall be attached to the GULFSTREAM G280 Airplane Flight Manual (AFM) for operators under TCCA registry, and used in lieu of similar Civil Aviation Authority of Israel (CAAI) approved data presented in the basic Gulfstream G280 AFM latest released revision.

Operation in compliance with the Limitations presented in Section I of this Airplane Flight Manual is required by the Transport Canada Civil Aviation.

SECTION I
LIMITATIONS

01-30-00: ICE AND RAIN PROTECTION

1-30-20: Wing Anti-Icing

NOTE

When SAE Type II, Type III or Type IV anti-icing fluids have been applied, the wing anti-ice system must only be selected ON, if required, just prior to thrust increase for take-off.

Add the above limitation in the location indicated:

TAKEOFF INTO KNOWN OR FORECAST ICING CONDITIONS - immediately above

SECTION IV
NORMAL PROCEDURES

CAUTION

WHEN FLYING IN ICING CONDITIONS, CREWS SHOULD PAY PARTICULAR ATTENTION TO ANY CAS MESSAGE THAT APPEARS. DO NOT ASSUME THAT IT IS JUST ANOTHER "ICE DETECTED" MESSAGE.

Add the above Caution note to the following procedures in the location indicated:

AFTER TAKEOFF - immediately following step 7
CLIMB TRANSITION - immediately following step 4
BEFORE DESCENT - immediately following step 2
DESCENT TRANSITION - immediately following step 2

COLD WEATHER OPERATIONS

Add the following note immediate prior to the "PRE FLIGHT" procedure of this section:

NOTE

Perform the following to prepare the airplane for flight after a prolonged cold soak at temperatures below -20° C.

1. Use GPU to assist the batteries for APU start.
2. Use of preheat capability, if available, to warm up the avionics in the nose compartment.
3. Warm up the cabin to temperature of +15° C using APU and Pack running and MED closed.
4. Once everything is warmed up, if spurious indications, faults or failures have occurred, during power up, shut down to a "black" airplane and power back up to reboot and clear these spurious indications, faults or failures.

BRAZILIAN AIRCRAFT
FLIGHT MANUAL SUPPLEMENT

This Airplane Flight Manual Supplement is approved by the Civil Aviation Authority of Israel on behalf of the "Agência Nacional de Aviação Civil"- ANAC for Brazilian registered aircraft, in accordance with the "Regulamento Brasileiros da Aviação Civil" - RBAC 21, Section 21.29.

This Supplement must be attached to the approved basic Gulfstream G280 Airplane Flight Manual, dated February 26, 2015 for Gulfstream series G280 airplanes serial number (S/N) 2001 and subsequent, having Brazilian certification.

The information contained herein supplements or supersedes the information of the basic Airplane Flight Manual. For Limitations, Normal Procedures, Abnormal Procedures, Emergency Procedures and Performance information not contained in this supplement, consult the basic Airplane Flight Manual.

AGÊNCIA NACIONAL DE AVIAÇÃO CIVIL- ANAC FLIGHT MANUAL SUPPLEMENT

INTRODUCTION

GENERAL

Add the following:

Data provided in this supplement shall be attached to the Gulfstream G280 Airplane Flight Manual (AFM) for Agência Nacional de Aviação Civil- (ANAC) operations, and used in lieu of similar Civil Aviation Authority of Israel (CAAI) approved data presented in the basic Gulfstream G280 AFM latest released revision.

Operation in compliance with the Limitations presented in Section 1 of this Airplane Flight Manual is required by Agência Nacional de Aviação Civil in accordance with the "Regulamento Brasileiros da Aviação Civil" - RBAC 21, Section 21.29.

SECTION I
LIMITATIONS
Add the following:

01-00-20: G280 Noise Standards (ANAC)

The following noise levels comply with RBAC part 36, corresponding to Title 14 CFR part 36, Appendix B, Stage 4 maximum noise level requirements and were obtained by analysis of approved data from noise tests conducted under the provisions of part 36, Amendment 36-28. The noise measurement and evaluation procedures used to obtain these noise levels are considered by the FAA to be equivalent to the Chapter 4 noise level required by the International Civil Aviation Organization (ICAO, Annex 16, Volume I, Appendix 2, Amendment 7, and effective March 21, 2002). For the Gulfstream G280 Jet, equipped with two Honeywell HTFG250 turbofan engines, the EPNLs at MTOW and MLW are: (noise levels are given in EPNdb)

Lateral	89.5
Flyover	75.2
Approach	90.5

No determination has been made by the Brazilian National Civil Aviation Agency (ANAC) that the noise levels of this aircraft are or should be acceptable or unacceptable for operation at, into, or out of, any airport.

Lateral and flyover noise levels were obtained at the maximum takeoff weight (MTOW) of 39,600 lb, takeoff flaps - 10° and anti-ice system off. Thrust reduction in accordance with Title 14 CFR Part 36 and ICAO Annex 16 was used to determine flyover noise level.

Approach noise levels were established on a 3° glide-slope, with landing gear down, flaps - 39°, APU - on, at the maximum landing weight of 32,700 lb.

Add new limitation
01-12-20: Aircraft Towing

1. Towing speed should not exceed 3 MPH.
2. Apply aircraft brakes only in emergency situations.
3. Do not exceed 84±3° angle between the tow and the aircraft.
4. Towing without the tow bar is allowed only with the following types of tugs
   - Lektro Tug AP8750CX series
   - Lektro Tug AP8850SDA series

Add new limitation
01-49-10: APU OPERATION

APU operations on the ground are allowed only for main Engine Starting.
Turn off the APU after completing Engine Starting.

NOTE

APU may be started and operated in-flight in accordance with the instructions and limitations of the Airplane Flight Manual.

Add new limitation
01-73-20: Automatic Power Reserve (APR)

Takeoff from contaminated runways with APR INHIBIT is prohibited.

SECTION II
EMERGENCY PROCEDURES
No Change.

SECTION III
ABNORMAL PROCEDURES
Change caution message to read as below:
IIIA-43 Caution Messages (amber)

Message	Triggered by	Corrective Action
FADEC Fail, L FADEC Fail, R FADEC Fail, L-R	Affected engine FADEC has failed.	In Flight: 1. Monitor engine parameters. 2. Avoid rapid thrust lever movements. ***NOTE***: If FADEC Fail Message appears, APR function might not be available, use APR – OFF performance and limitations outlined below in this supplement. **On Ground:** 1. Do not dispatch.

ANAC APPROVED
9 Dec 2015

SECTION V
PERFORMANCE WET AND DRY

No Change.

Supplement 11

APR - OFF PERFORMANCE

The general information in the introduction section is applicable with the addition of the following:
This supplement should be used whenever performance data is to be obtained from Section V of this AFM and the engine APR system is INHIBITED.
APR OFF is only possible when pilot is selecting APR INHIBIT option through the SMC.

SECTION I
LIMITATIONS
Takeoff from contaminated runways with APR INHIBIT is prohibited.

SECTION II
EMERGENCY PROCEDURES
No change.

SECTION III
ABNORMAL PROCEDURES
No change.

SECTION IV
NORMAL PROCEDURES
To select APR INHIBIT –

1. SMC – THRST – Select APR Inhibit (long selection)
   Auto APR Inhibit caution CAS will come on.
   RSK 4 selection button will appear on SMC.
2. SMC – THRST – Select APR INH ACK
   The Auto APR Inhibit caution CAS will turn to a status Auto APR Inhibit CAS.

To de select APR INHIBIT –

1. SMC – THRST – Deselect APR Inhibit
   Auto APR Inhibit caution CAS will clear.

   SMC – THRST – Deselect APR INH ACK
   The Auto APR Inhibit status CAS will turn to a caution Auto APR Inhibit CAS.

CAAI APPROVED
29 Oct 2015

APR - OFF PERFORMANCE

With APR INHIBITED, the performance data in Section V Performance Wet and Dry are applicable with the addition of corrections as presented in Figure X-11-1. through Figure X-11-4.
All other performance data in section V remain unchanged.

Procedure -

1. Calculate aircraft performance with APR ON according to Section V.
2. Apply relevant corrections to step 1 according to Figure X-11-1. through Figure X-11-4.

VERTICAL WEATHER DISPLAY (VWX)

GENERAL

This supplement is required for operation of a G280 aircraft equipped with certified software version 3.6.1 (MOD G25-10074), RTA-4218 and with VWX and PWS functionality enabled.

SYSTEM DESCRIPTION

Vertical Weather (VWX) radar uses vertical scans to display weather returns on the VSD format.
The VWX display range limit is 100 NM.

VWX shall be active when:

- WX is On
- VSD/VWX is selected on MAP
- WX control mode AUTO
- WX mode is WX or WX+T

To display VWX information, the VSD/VWX Map View should be selected in the MAP menu.

NOTE

Turbulence will not be depicted on VWX
VWX data will not available when the WXR is Off, or in Ground mapping mode.
When VWX is Off there will be no indication of a lack of VWX data.

Figure X-15-1. VWX display selection

The VWX display includes indications of Azimuth control indicator, Lateral reference annunciation and VSD overlay annunciation:

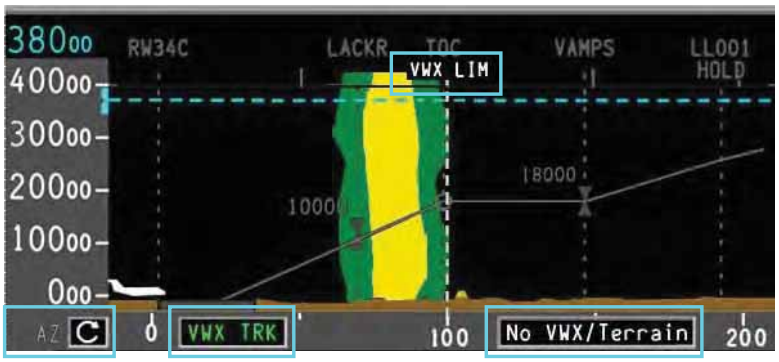

Figure X-15-2. VSD/VWX display indications

Lateral Reference Annunciation:

VWX TRK Radar scan aligned with aircraft track
When in "VWX AZ" and the pilot clicks the cursor anywhere on the VSD - the Lateral Reference will change back to TRK.

VWX AZ Radar scan aligned with Azimuth setting
Controlled by CCD scroll knob (rate aided)
VWX AZ shall default back to VWX TRK after 30 seconds since last azimuth selected.

VSD Overlay Annunciation:

"NO Terrain" Terrain data is not available (VWX on or OFF)

"NO VWX" VWX is ON + VWX data is not available

"NO VWX/Terrain" VWX is ON + VWX data is not available + terrain data is not displayed

Supplement 15

Azimuth Information:

Azimuth scan angle is displayed on the MFW map
Range is ± 60° when PWS is inactive (± 45° when PWS is active)
VWX scans are not always possible or allowed.

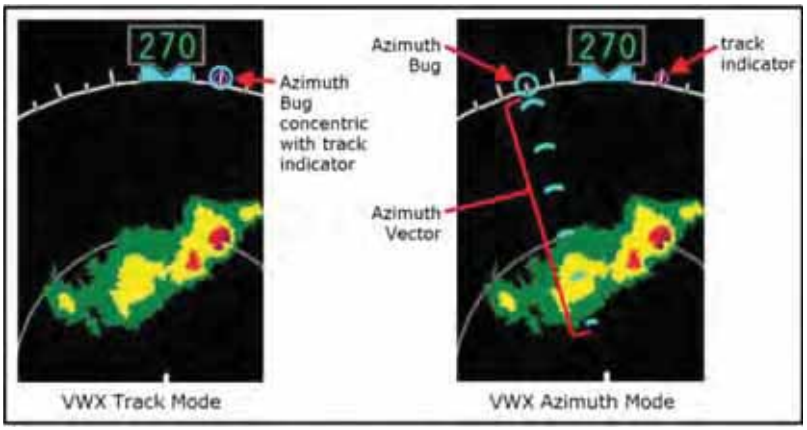

Figure X-15-3. Vertical azimuth indicator on lateral MAP

SECTION I
LIMITATIONS

The intended function of the vertical weather display is to depict the vertical profile of weather radar returns shown on the horizontal MAP display along the azimuth that has been selected by the pilot. Vertical weather echoes in the absence of a corresponding return on the horizontal MAP display are not associated with actual weather. These echoes are short time events, and are discernable as the MAP lateral weather display shows no corresponding echoes at that range.

These echoes may appear at any range when flying at any altitude but will most likely occur when below 15000ft in the following way:

- For a few seconds as a vertical thin line at a range equal to the altitude (0.5 to 3NM).
- As a large echo, rising from ground, when flying directly ("nose-on") toward a large city comprised of numerous high-rise buildings by a large body of water. The echo will be collocated geographically with the city.

Turning off the vertical weather display when weather returns do not appear on the MAP will prevent the display of returns not associated with actual weather.

Supplement 15

PREDICTIVE WINDSHEAR (PWS)

GENERAL

This supplement is required for operation of a G280 aircraft equipped with certified software version 3.6.1 (MOD G25-10074) and RTA-4218 and PWS functionality enabled.

SYSTEM DESCRIPTION

Predictive windshear radar uses Doppler processing techniques to detect:

- Performance decreasing conditions
- Increasing tailwind
- Decreasing headwind

The PWS radar provides visual and aural indications to help pilots avoid windshear areas during takeoff, approach and landing.

The PWS provides similar windshear warning and caution alerts as the TAWS. When PWS alerts are triggered, the MAP MFW and HSI shall default to 5 NM range and show PWS icons aligned to the hazardous azimuth.

NOTE

The PWS does not provide Flight Director escape guidance.

Takeoff Mode:

The PWS function is activated while on the ground when either:

- WX STBY and engines running and takeoff thrust applied, or
- Any other WX mode

The PWS alerts are inhibited, on takeoff, between 80kts and 50 feet AGL.
PWS is active after takeoff until the radio altitude is greater than 2400 feet AGL.

Landing Mode:

PWS will start scanning for windshear below 2300 feet AGL and alert for windshear below 1200 feet AGL until touchdown. The PWS alerts are inhibited during landing roll.

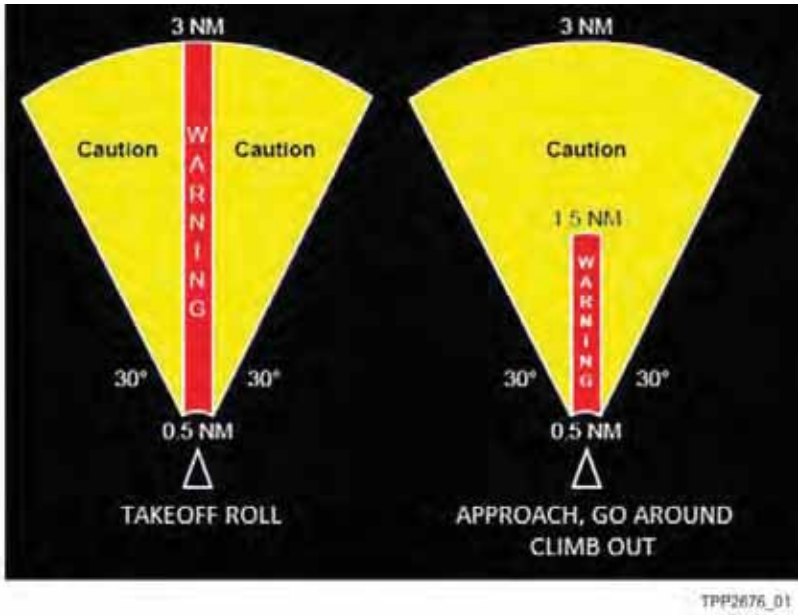

Figure X-15-4. PWS alert regions
Detects a windshear Alert from 3 to 5 nm.

NOTE

For details system description see RTA-4218 MultiScan™ Weather Radar operator's guide, PN 5230818856, Second edition, 27 March 2018 (or later applicable revision), pages 3-17 to 3-22 (or later applicable revision).

SECTION II
EMERGENCY PROCEDURES

PWS WINDSHEAR WARNING ESCAPE PROCEDURE (RED):

On takeoff:
When the aural warning "WINDSHEAR AHEAD, WINDSHEAR AHEAD" is sounded and W/S AHEAD red annunciation warning comes on the PFD.
On the ground:
1. Abort takeoff (if possible)

NOTE

The PWS alerts are inhibited, on takeoff, between 80kts and 50 feet AGL. Therefore, the abort will be performed below 80kts.

Once airborne:
1. Avoid depicted windshear areas on radar display.
2. Be prepared to execute a windshear escape procedure if the TAWS Warning reactive windshear alerting occurs.

On approach and landing:

When "GO AROUND WINDSHEAR AHEAD" is sounded and W/S AHEAD red annunciation warning comes on the PFD:
1. Press TOGA button and execute normal go around.
2. Avoid depicted windshear areas on radar display.
3. Be prepared to execute a windshear escape procedure if the TAWS Warning reactive windshear alerting occurs.

NOTE

The TAWS Warning reactive windshear escape procedure is on AFM Supplement No.1, G280 Terrain Awareness and Warning System (TAWS), page X-1-12

PWS WINDSHEAR CAUTION PROCEDURE (AMBER):

At any phase of flight:
When the aural caution and "MONITOR RADAR DISPLAY" is sounded and W/S AHEAD amber annunciation alert comes on the PFD , or, the crew recognizes early signs of windshear conditions, the following procedure should be followed:

1. The crew should be alert to the possibility of subsequent decreasing performance (i.e, significant airspeed loss and down draft conditions)
2. Adjust heading according to MAP MFW to keep clear of danger azimuth.

Advisory Windshear Alert

In advisory mode the system detects a windshear Alert from 3 to 5 nm. No textual or aural alerts are issued, only the PWS Icon is displayed.

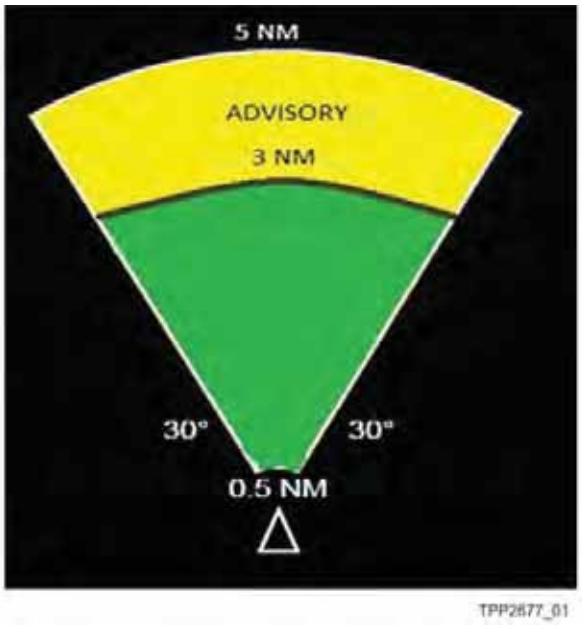

Figure X-15-5. PWS Advisory Alert Area

NOTE

PWS advisories may be enabled or disabled in the APM Options partition.

Advisory CAS Messages

Message	Cause(s)	Corrective Action
PRED Windshear Fail	Predictive Windshear function has failed. **NOTE:** PWS is not available when radio altimeter is failed.	Log for Maintenance

PRO LINE FUSION PWS MESSAGE ON MAP MFW

PWS FAULT amber legend on MAP MFW shows to indicate that the PWS function has failed. The radar will exit the PWS function and will not attempt to display windshear data.

SYSTEM ACTIVATION

The PWS does not use any dedicated controls. PWS is active when at least one engine is running and WX is not failed.

SELF-TEST

The PWS should be tested prior to flight. Select RDR TEST on the SMC - WX page.

When the WX test is activated, the following occur:

1. Within approximately 15 seconds the display system will display the radar test pattern.

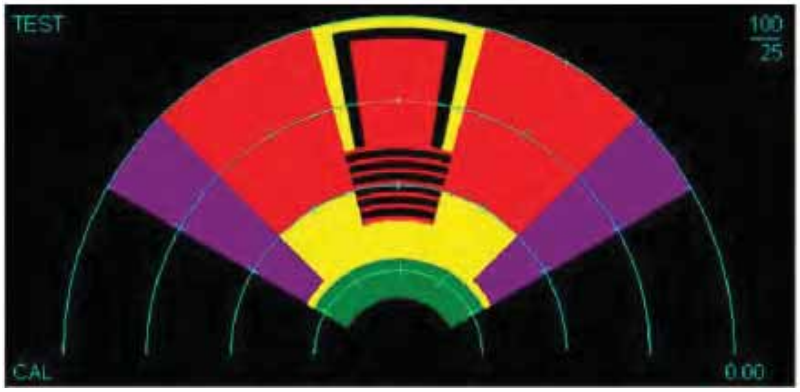

Figure X-15-6. WX test pattern with PWS enabled

Figure X-15-7. WX test pattern with PWS enabled on vertical weather display (VWX)

2. The PWS Windshear Caution textual alert shows for 3 seconds and the Monitor Radar Display caution aural from the aural warning system can be heard. The PWS Caution textual typical shows in yellow or amber.
3. A PWS Fault shows on the display for 3 seconds
4. The PWS Windshear Warning textual alert shows for 3 seconds the Go Around Windshear Ahead warning aural from the aural warning system can be heard. The PWS warning textual typically shows in red.
5. A 3 second delay occurs.
6. The PWS Windshear Warning textual alert shows for 3 seconds and the Windshear Ahead, Windshear Ahead warning aural from the aural warning system can be heard. The PWS warning textual typically shows in red.
7. A 3 second delay occurs.
8. After approximately 18 seconds, the radar test pattern in Figure X-15-4 and Figure X-15-6 are displayed.

NOTE

Expanded WX test is outlined in RTA-4218 MultiScan™ Weather Radar operator's guide, PN 5230818856, Second edition, 27 March 2018 (or later applicable revision), pages 3-22 to 3-27 (or later applicable revision).

ROCKWELL COLLINS PRO LINE FUSION SURFACE MANAGEMENT SYSTEM (SMS)

GENERAL

This supplement is required for operation of a G280 aircraft equipped with certified software version 3.6.1 (MOD G25-10074) and Service Bulletins #280-34-273; 280-34-290; 280-34-291; 280-34-292 and SMS functionality enabled.

SYSTEM DESCRIPTION

General

The SMS Takeoff/Landing Awareness Function (TLAF) is designed to provide surface situational awareness at airports.

The SMS is a software which resides in the FMS.

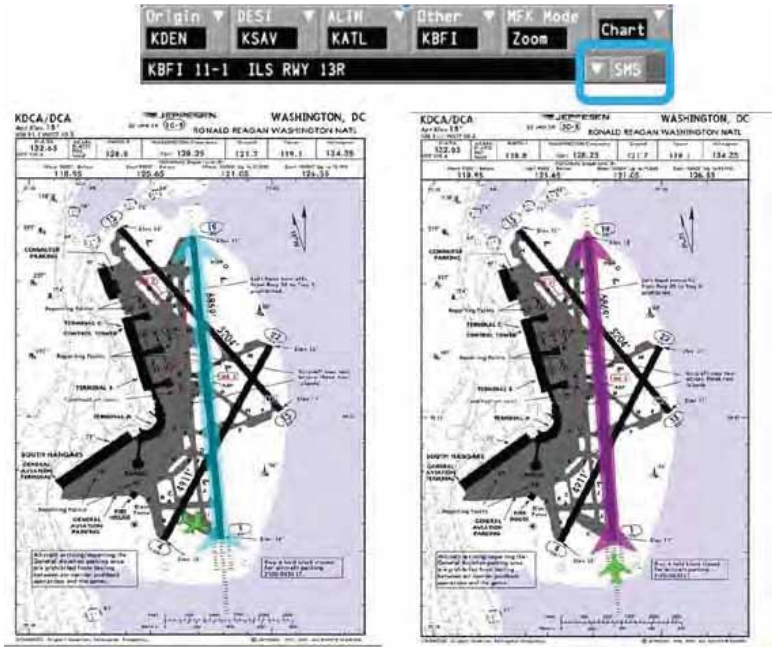
The Surface Management System (SMS) uses information from the FMS and IFIS to show the crew if the aircraft is using the correct runway for takeoff and landing, or if the runway is too short for takeoff or landing. The SMS uses the RIU to play warning aurals, and the DU to show alert messages. The SMS may be inhibited using an installer-supplied pushbutton.
The V1 (or 60 kts if V1 is not computed) threshold is used to disable the alerts if they were triggered and the takeoff was continued.

Runway Highlighting

On a geo-referenced airport diagram, the aircraft's position can be correlated to a particular place on the airport chart. Using the FMS database and flight plan, the SMS highlights the runway that is in the FMS flight plan on one of these geo-referenced airport diagrams. The takeoff runway is showed in cyan and landing runway is showed in magenta colors, with arrows to show the aircraft direction on the runway.

The SMS selection button activates the runway highlighting on the chart.

The following figure shows a 1/2 Multi Function Window with Chart displayed, and takeoff and landing runways highlighted with aircraft ownship position:



Takeoff Runway Highlighted Landing Runway Highlighted

Figure X-16-1. Highlighted Runways

SMS Alerts

The SMS provides aural alerts and associated Engine Indication and Crew Alert System (EICAS) messages before a commitment to takeoff or land has been reached to help ensure that the aircraft can takeoff or land safely. This functionality is called Takeoff and Landing Alert Function (TLAF). TLAF checks the following situations:

- Upon starting and during takeoff, is the aircraft lined up with a runway.
- Upon starting takeoff, is the remaining runway long enough.
- Upon starting takeoff, is the runway the aircraft is on the same runway that is programmed in the flight plan.
- Before landing, is the aircraft lined up with a runway.
- Before landing, is the aircraft lined up with a runway that is long enough.

If the answer to any of the above questions is NO, a notification in the form of an aural annunciation and associated message EICAS is produced. The annunciation should be given with enough time for either the takeoff or landing to be aborted. GPS data is used to determine the position and track of the aircraft as well as the ground speed. The FMS database is used to determine the position of the runways.

Takeoff Alert mode 1 - NOT A TAKEOFF RUNWAY

The SMS TLAF compares the current aircraft position and heading with all the runways at the departure airport.

The alert is generated if Takeoff thrust is applied or ground speed is greater than 35 knots, while the aircraft is not aligned with any runway. The alert will trigger a continuous aural "NOT A RUNWAY" callout, and a Not A Runway warning CAS message.

The alert will clear once ground speed is below 25 knots and thrust levers are back.

NOTE

Attempting to comply with an Immediate take-off clearance by promptly starting an uninterrupted roll from taxiway (rolling takeoff) may generate a Mode 1 Take-off Alert even though the correct runway is being engaged if the N1 exceeds 70% or the ground speed exceeds 35kts prior to aircraft being aligned on runway heading.

Takeoff Alert mode 2 -TAKEOFF RUNWAY TOO SHORT

The SMS TLAF compares the takeoff field length (computed by the FMS) to the actual runway distance remaining based on the current aircraft position (from the GPS) and the end of the runway.

The alert is generated if Takeoff thrust is applied or ground speed is greater than 35 knots, and runway distance remaining is insufficient for takeoff.

The alert will trigger a continuous aural "SHORT RUNWAY " callout, and a Short Runway warning CAS message.
The alert will clear once ground speed is below 25 knots and thrust levers are back.

NOTE

Changing Line-up distance or manually shortening the takeoff runway will reduce runway length. An updated runway length which is shorter than BFL, will result in the SHORT RUNWAY warning when the takeoff roll begins (while there may be enough runway length for a safe takeoff).

Takeoff Alert mode 3 -TAKEOFF RUNWAY MISCOMPARE

The SMS TLAF compares the actual takeoff runway, based on the aircraft's position and heading, to the programmed departure airport.

The alert is generated if Takeoff thrust is applied or ground speed is greater than 35 knots, and aircraft is on a runway different than the FMS programmed departure runway.

The alert will trigger twice an aural “NOT FMS RUNWAY” callout, and a Not FMS Runway caution CAS message.
The alert will clear once ground speed is below 25 knots and thrust levers are back.

Landing Alert mode 4 -LANDING NOT A RUNWAY

The SMS TLAF compares the aircraft's position and track to the runways of the nearest airport.

The alert is generated if the aircraft is below 250 feet above the airport and not aligned with a runway.

The alert will trigger a continuous aural "NOT A RUNWAY" callout, and a Landing Not a Runway warning CAS message.
The alert will clear once TOGA switch is pressed, or aircraft climbs to 500 feet above airport elevation.

NOTE

The TLAF landing mode 4 does not alert from landing on a runway different than the programmed one. It alerts from landing on a taxiway or anywhere that is not a runway. The system is designed for flexibility of performing a side step landing and an approach to a circle for landing without nuisances.

Landing Alert mode 5 -LANDING RUNWAY TOO SHORT

The SMS TLAF compares the aligned landing runway to the required landing length as computed by the FMS.

The alert is generated if the aircraft is below 250 feet above the airport and aircraft is aligned with a runway that is too short.

The alert will trigger a continuous aural "SHORT RUNWAY" callout, and a Short Runway warning CAS message.
The alert will clear once TOGA switch is pressed, or aircraft climbs to 500 feet above airport elevation.

Alerts Inhibition

SMS aural alerts and EICAS messages can be inhibited by selection of SMS OVRD pushbutton on TAWS pedestal panel. When the SMS alerts are inhibited by the pushbutton, the SMS Override Status CAS message is displayed.

When Takeoff Field Length (TOFL) or Landing Field Length (LFL) is not calculated, the SMS short runway calculations are invalid and the SMS - Input PERF Data advisory CAS is displayed.

NOTE

Manually changing the landing runway to a value shorter than LDA, will result in the SHORT RUNWAY warning at short final.

SECTION I LIMITATIONS
No Change

SECTION II
EMERGENCY PROCEDURES

Warning CAS Messages

Message	Cause(s)	Corrective Action
Not A Runway "Not a Runway" aural (continuous)	Attempting a takeoff or landing not on a runway	On takeoff - 1. Abort takeoff On Landing - 1. Reject landing
Short Runway "Short Runway" aural (continuous)	Attempting a takeoff or landing on a runway which is too short	On takeoff - 1. Abort takeoff On Landing - 1. Reject landing

SECTION III
ABNORMAL PROCEDURES

Caution CAS Messages

Message	Cause(s)	Corrective Action
Not FMS Runway "Not FMS Runway" aural (twice)	Takeoff runway disagrees with departure runway	On takeoff - 1.Abort takeoff

Advisory CAS Messages

Message	Cause(s)	Corrective Action
SMS - Input PERF Data	Both SMS Takeoff and Landing Advisories not available due to lack of information available for FMS to perform calculations (e.g. system supplied data and/or pilot supplied data) The message is inhibited when parking brake is on and when 2400 feet above destination altitude.	1. FMS PERF Data - CHECK
SMS Fail	SMS related functionality has failed	Log for Maintenance

Status CAS Messages

Message	Cause(s)	Corrective Action
SMS Override	SMS alerts are inhibited via TAWS panel SMS OVRD pushbutton	None

To intentionally disable SMS:

SMS OVRD PushbuttonOVRD

NOTE

SMS Override status CAS message is displayed.
All SMS Aural and Visual alerts are inhibited.

If intentionally landing on a surface other than a runway in the FMS Database, disable SMS.

If actual available runway length does not match the runway length in the FMS Database, Disable SMS or Manually Update FMS RWY LENGTH

Manually Updating FMS RWY LENGTH:

For takeoff:
If the runway threshold is correct, but the runway is shortened, insert a new shortened runway length on FMS TAKEOFF REF Performance Page 1/5.
If the runway is shortened due to a displaced threshold, insert the correct lineup distance on FMS TAKEOFF REF Performance Page 2/5. This same method can be used for an intersection takeoff.

For landing:
Update RWY LENGTH on the FMS APPROACH REF Performance Page 1/5 to match the actual landing runway length available.

NOTE

Verify updated runway length matches aircraft performance.

MITIGATION OF POTENTIALLY EXPLOSIVE DEVICE

GENERAL

The general information in the introduction section is applicable with the addition of the following:

SECTION I
LIMITATIONS

No change.

SECTION II
EMERGENCY PROCEDURES

MITIGATION OF POTENTIALLY EXPLOSIVE DEVICE

If an object suspected to be an explosive device is discovered in the aircraft in flight:

1. Declare emergency, inform Air Traffic Control of the nature of the emergency, request immediate descent and landing at the nearest suitable airport
2. Place the object against the right emergency exit window and cover it with materials such as clothing, cushions and blankets
3. Crew and passengers - Withdraw as far away from the object as possible

NOTE

If all occupants are in the forward cabin, expect forward CG on landing.

4. Descend to as low an altitude as practicable
5. Depressurize the cabin as soon as possible
6. Land as soon as possible
7. Request parking in an isolated area
8. Vacate aircraft as soon as possible (see EMERGENCY EVACUATION, page II-87)

TAKEOFF AND LANDING IN CROSSWIND CONDITIONS

This supplement provides additional procedures, techniques, or information recommended for the operation of G280 aircraft under normal or emergency conditions. Information contained herein supplements information in basic Airplane Flight Manual. For limitations, procedures and performance information not contained in this Supplement, consult basic Airplane Flight Manual.

Date: 26 Aug 2012 Manual No._____

OIS 2

TAKEOFF AND LANDING IN CROSSWIND CONDITIONS

GENERAL

This supplement provides additional information and guidance for takeoff and landing in crosswind conditions. The maximum demonstrated crosswind component for takeoff and landing is that component of crosswind that was demonstrated during certification testing. For the G280, for maximum demonstrated crosswind, see DEMONSTRATED CROSSWIND, page V-13.

The general information in the introduction section is applicable with the addition of the following:

SECTION I
LIMITATIONS

No change.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

No change.

CROSSWIND TAKEOFF PROCEDURE

The crosswind technique for takeoff requires that the copilot hold aileron into the wind with slight forward pressure on the control wheel to maintain nosewheel contact with the runway throughout the takeoff roll. The recommended pilot technique is to use nosewheel steering (NWS) to align with the runway and then to rely on pedal steering for the takeoff.

For high crosswinds, the pilot normally uses NWS to maintain runway alignment until the combination of pedal nosewheel steering and aerodynamic rudder control becomes effective enough to provide steering. The rate of transfer from NWS to rudder steering is a function of runway condition (wet, icy, etc.) and the magnitude of the crosswind. The nosewheel steering available using rudder pedals is 3° either side of center. This is sufficient to handle most crosswind situations but may require the pilot to use full rudder pedal deflection. As a result of the larger than normal rudder pedal deflections required, pilots tend to use NWS more in a crosswind takeoff. For crosswind, the point of sufficient control to counter the yawing is at a higher speed than the no wind condition. The important point to remember is that nosewheel steering is very effective in providing directional control and that to be effective, the nose wheel has to maintain contact with the runway.

(Continued)

The transfer of control wheel control during crosswind takeoff may be delayed due to the necessity of maintaining control using the NWS. Once it is assured that there is sufficient aerodynamic rudder control, the transfer of control of the control wheel to the pilot can proceed. The pilot should still maintain forward pressure on the control wheel sufficient to maintain nose wheel contact with the runway and aileron deflected into the wind throughout the takeoff roll until liftoff is achieved. For takeoff on wet or icy runways, the crosswind component is reduced as indicated in Figure 11-2-1.

NOTE

The contaminated runway crosswind components chart is not based on actual test results. It was developed from a wide variety of landing operations for various aircraft at varying landing conditions. Landing on precipitation covered runways can have significant additional risks and should not be casually made. See contaminated runways supplement.

CROSSWIND LANDING PROCEDURE

The Pilot Flying should evaluate the crosswind conditions. If the crosswind component is near maximum demonstrated crosswind of 25 knots, consideration should be given to using flaps 20 vs flaps LND for the approach and landing. Using flaps 20 will increase the approach speed by approximately 5 knots which will reduce the sideslip angle required during the approach (recalculate VREF and LDA for flap 20, note that actual landing distance increases 12% per 10 knots above VREF). If using flaps 20, select TAWS FLAPS OVRD ON. Flaps 20 landing distance is approximately 4% greater than Flaps LND and actual landing distance increases 12% per 10 knots above VREF.

During the final approach phase of crosswind landing, fly aligned with or slightly upwind of the runway center line utilizing crab into the wind technique sufficient to stabilize the aircraft in drift. Due to the varying crosswind components, change the amount of crab angle as the aircraft descends. Maintain airspeed during the approach at VREF + half the steady wind component + the full gust value not to exceed a 20 kt addition to VREF. Maintain this speed until the flare.

The flare should be a minimal pitch change to arrest the descent once the aircraft is in ground effect. A prolonged float after flare increases pilot workload during touchdown. Drift correction during touchdown is far easier when the pilot can control the timing of the touchdown. See ACTUAL LANDING DISTANCE, Page V-53, for landing distance increase.

Approaching touchdown, rudder is applied to align the aircraft with the runway and simultaneous opposite aileron is applied to achieve zero drift. This combination of wing down/opposite rudder will be coordinated throughout the last portion of the landing approach until touchdown. Touchdown with the upwind landing gear first then set the other main landing gear on the runway without delay. Use the rudder as needed to keep the aircraft on the runway centerline. Use aileron into the wind as necessary early during landing to keep the upwind landing gear on the runway. Immediately on touchdown, lower the nosewheel to the runway and apply sufficient forward pressure on the control wheel to maintain nosewheel contact with the runway. Use

aerodynamic corrective rudder and aileron inputs throughout the landing roll. As rollout speed decreases to the point where rudder effectiveness decreases, shift directional control to NWS and normal braking. The copilot, when directed by the pilot, takes control of the control wheel and maintain forward pressure and aileron into the wind. The use of thrust reversers is optional, but be aware that in crosswind landing, thrust reversers are destabilizing.

Do not deploy the thrust reversers at the expense of keeping the aircraft on the runway centerline. For landing on wet or icy runways, the contaminated runway crosswind component is reduced as indicated in Figure 11-2-1.

USE OF CROSSWIND CHART

The contaminated runway crosswind components chart (Figure 11-2-1) is applicable only to headwind conditions. Operation with any tailwind component on contaminated runways is not recommended due to the inherent hazards of operating on such runways.

To find the crosswind component associated with the reported runway condition, enter the Canadian Runway Friction Index (CRFI) scale or Braking Coefficient scale and read upward on the crosswind component scale.

ELEVATORS MANUAL REVERSION

GENERAL

The general information in the introduction section is applicable with the addition of the following:

SECTION I
LIMITATIONS

No change.

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

ELEVATORS MANUAL REVERSION

1. During the loss of both hydraulic pressure to the elevator actuators, the pilot can fly the aircraft using the manual linkage between pilot and copilot columns to the elevators.
2. If one hydraulic system has failed, the control wheel forces for elevator operations may be slightly higher or transparent to the pilot. When the second hydraulic system pressure is dropped, both elevators surfaces move down up to 2°, until they are in balance with aerodynamic loads and gravity. The pilot first reaction is to take the control wheel backwards to eliminate the aircraft pitch-down tendency. The control wheel forces may be up to 150 lb at that moment. Using stabilizer pitch trim reduces the control wheel forces up to zero.
3. When flying with zero pitch forces, any change to speed, configuration, engine thrust, pitch correction or passenger movement (cg shift), may cause the aircraft to develop small pitch attitude change, depending on the cause of change. The pilot should initially react with the control wheel opposite to the pitch trend and then use the stabilizer trim for control wheel force reduction. If the pilot moves the control wheel from aft input to forward input, a backlash of a few millimeters between these two points is felt.
4. For safe return to landing:
   a. Stabilize the pitch trend using the control wheel
   b. Trim the aircraft to minimize pitch forces
   c. Reduce speed to 200-220 KIAS
   d. Advise ATC and declare intentions
   e. Recommended, at a distance of 30 nm from FAF, reduce speed gradually to flaps 20°

(Continued)

f. Recommended, at 5 nm before FAF, lower the landing gear then lower flaps to LND and maintain V_{REF} + 20 kt (use stabilizer trim to counter control wheel forces for any configuration change)
g. Below 500 ft, reduce speed to V_{REF} + 10 kt, trim the aircraft for small control wheel back pressure. (to avoid free play in the backlash area)
h. At 30 ft, maintain approach thrust until the aircraft rate of descent is reducing slightly. Now, reduce thrust to idle and maintain control wheel position. The aircraft raises the nose for flare due to the reduction of pitch down moment due to engine thrust change, and wait for firm touch-down
i. After touchdown, release the control wheel back pressure, transfer controls to the copilot, move hand to the tiller and continue a normal landing

5. During missed approach, raise flaps to 20° and simultaneously increase engine thrust gradually. Use stabilizer trim to compensate for pitch-down moment that the aircraft may develop due to the increase of engine thrust. Using the engine slow acceleration technique, the aircraft can be easily controlled. Maintain this configuration during the whole missed approach procedure until reaching the FAF and perform step 4,f.

NOTE

The initial pitch-down moment when the failure occurs, may surprise the crew. Workload is reduced significantly when stabilizer trim is used. Perform any change gradually to ensure comfortable handling of the aircraft.

OIS 4

KNOWN CAS/OMS MESSAGE ISSUES

INTRODUCTION

GENERAL

The G280 was certified with a number of known CAS / OMS messages that may be displayed during power up on the ground or during flight. These CAS messages normally extinguish without any pilot action after a short time. There is no requirement for the flight crew to log the occurrence of any of these messages for maintenance action, if they are displayed according to the guidance in this supplement.

SECTION A: AVIONICS 3.6

SECTION IIIA – CAUTION MESSAGES

The following amber caution CAS messages may appear during power up or in flight. Generally, no pilot action is required to clear the message except as noted under Corrective Action column.

Message	Triggered By	Corrective Action
APU Door Failed Open	On battery power during power up.	Self clears when APU Master is selected ON.
APU Generator Fail	Generator fails to come on line after start.	Push RESET. Refer to AFM.
BAS OFF	Temporary closure of the MPRSOV, typically when high thrust is set during initial climb after takeoff.	Self-clearing when thrust lever setting is reduced during cruise. **NOTE**: CAS message is inhibited with TLA>= 40 degrees with the aircraft below 28k feet; therefore, it is most likely to appear when climbing with thrust levers set slightly less than CLB. **NOTE**: The manifold duct on the synoptic will show the condition of the BAS system at all times, even when the CAS message is inhibited. It will indicate amber when the BAS OFF condition exists.

Message	Triggered By	Corrective Action
Check SMC – Heading	On ground caused by iron in taxiway or runway	Taxi to another area to clear message. Perform fast erect.
ENG Oil Level Check, L ENG Oil Level Check, R	During engine start.	Self-clearing.
Fuel Transfer Fault	May occur during taxi due to fuel slosh in forward fuel tank. May occur during prolonged APU operation on ground. May occur during initial climb after takeoff due to fuel migration into center tank.	Self-clearing. Transfer fuel to right feed tank as needed. Self-clearing when wings level and fuel returns to wing tanks.
Gear Bottle PRESS Low	Occurs on long flights when bottle gets cold soaked.	Self-clearing after bottle warms up after landing. Do not take off if message is displayed.
HYD QTY Refill, L HYD QTY Refill, R	Momentary after high demand on hydraulic system	Self-clearing

Message	Triggered By	Corrective Action
Q-Feel Fail	Simultaneous activation of both hydraulic EMPs during initial power up when distribution bus not powered (generator or external power not on line.)	If still displayed after airplane power up with both engines running: 1. Perform FCECU reset - Pull two (2) FCECU 2 CBs (F14, and G14) for 10 seconds and then reset simultaneously. 2. Do not interfere with flight controls for 40 seconds. 3. Perform full flight control sweep.
Rudder Fail	Activation of left or right hydraulic EMP.	Self-clearing.
WAI System Fail, R	Distribution bus not powered (generator or external power not on line.).	Self-clearing when generator or external power is on line.
Yaw Damper Off	On ground during taxi.	Select YD - ON

THIS PAGE
INTENTIONALLY
LEFT BLANK

SECTION IIIB - ADVISORY MESSAGES

The following cyan advisory CAS messages may appear during power up or in flight. Generally, no pilot action is required to clear the message except as noted under Corrective Action column.

Message	Triggered By	Corrective Action
APU Door Failed Close	Momentary when APU Master selected ON.	Self-clearing.
Autobrake Disarmed	Applying brakes when throttle is above idle.	Autobrake – AS REQUIRED.
Check OMS	Faults are active and recorded by the OMS. Ground only message.	Record active faults in MAINT MGR - MENU, ACTIVE FAULTS. Message extinguishes after. takeoff
CVR 1 Fail	Improper feedback during recurring CVR power check. May appear repeatedly for several minutes (Pre MOD G25-20029 only).	Self-clearing within 5 minutes.
Datalink COM In Voice	Momentary timing sequence in software.	Self-clearing.

Message	Triggered By	Corrective Action
FDR Interface Maintenance	Control column is pulled back past 13.4° during preflight control checks. **NOTE**: There is no need to hit the aft stop during preflight control checks. Only pull the control column slowly aft until the elevators fill with green on the flight. controls synoptic.	Self-clearing.
MED Maintenance REQD	Red push plate in MED operating handle is not fully depressed when door is open.	Press the red push plate until it latches in position.
TAWS Fail	Momentary on ground due to poor GPS signal.	Self-clearing when airplane is moved away from structures causing interference with GPS signals.
Terrain Fail	Momentary on ground due to poor GPS signal.	Self-clearing when airplane is moved away from structures causing interference with GPS signals.
WWS Maintenance REQD	Improper signal from WWS components.	Message may remain on the entire flight or appear intermittently. Do not log for maintenance if system is operating normally.

SECTION IIID - OMS MESSAGES

The following OMS messages will be active after power up with the engines running. No action required to dispatch.

Message	Triggered By	Corrective Action
ADC1 has an internal fault	Software initialization issue	None required. Self-clearing before take off
ADC2 has an internal fault	Software initialization issue	None required. Self-clearing before take off
ATC/TCAS1 Output Bus L-TSS-XT is Disconnected / Failed	Software initialization issue	None required.
ECU 9284 FWD Heating Device Failure	Software initialization issue	None required.
G540DA51 Drain Valve 4" Heating Device Failure	Software initialization issue	None required.
HF RX/TX 1 Internal Fault Label 351/27	Software initialization issue	None required.
Pack Inlet Valve Fail Closed	Software initialization issue	None required.
PS9283_Aft Pressure Sensor Defect	Software initialization issue	None required.
PWP 9282 FWD Heating Device Failure	Software initialization issue	None required.

Message	Triggered By	Corrective Action
Reference Mesh Sensor Defect Degraded Measurement Accuracy	Software initialization issue	None required.
TA is not visible on CAN bus	Software initialization issue	None required.
WCU internal failure minor	Software initialization issue	None required.
WCU Shop Mode Pin Failure	Software initialization issue	None required.
WWP CAN bus failure	Software initialization issue	None required.
WWS System Vacuum Waste Maintenance Required	Software initialization issue	None required.
WWS System Potable Water Maintenance Required	Software initialization issue	None required.

SECTION B: AVIONICS 3.6.1

SECTION IIIA – CAUTION MESSAGES

The following amber caution CAS messages may appear during power up or in flight. Generally, no pilot action is required to clear the message except as noted under Corrective Action column.

Message	Triggered By	Corrective Action
APU Generator Fail	Generator fails to come on line after start.	Push RESET. Refer to AFM.
Check SMC – Heading	On ground caused by iron in taxiway or runway	Taxi to another area to clear message. Perform fast erect.
Gear Bottle PRESS Low	Occurs on long flights when bottle gets cold soaked.	Self-clearing after bottle warms up after landing. Do not take off if message is displayed.
HYD QTY Refill, L HYD QTY Refill, R	Momentary after high demand on hydraulic system	Self-clearing

Message	Triggered By	Corrective Action
Q-Feel Fail	Simultaneous activation of both hydraulic EMPs during initial power up when distribution bus not powered (generator or external power not on line.)	If still displayed after airplane power up with both engines running: 1. Perform FCECU reset - Pull two (2) FCECU 2 CBs (F14, and G14) for 10 seconds and then reset simultaneously. 2. Do not interfere with flight controls for 40 seconds. 3. Perform full flight control sweep.
Rudder Fail	Activation of left or right hydraulic EMP.	Self-clearing.

SECTION IIIB - ADVISORY MESSAGES

The following cyan advisory CAS messages may appear during power up or in flight. Generally, no pilot action is required to clear the message except as noted under Corrective Action column.

Message	Triggered By	Corrective Action
Autobrake Disarmed	Applying brakes when throttle is above idle.	Autobrake – AS REQUIRED.
Check OMS	Faults are active and recorded by the OMS. Ground only message.	Record active faults in MAINT MGR - MENU, ACTIVE FAULTS. Message extinguishes after. takeoff
CVR 1 Fail	Improper feedback during recurring CVR power check. May appear repeatedly for several minutes (Pre MOD G25-20029 only).	Self-clearing within 5 minutes.
SMS Fail	Momentary due to poor GPS signal below 2000 ft AGL	Self-clearing when GPS reception is sufficient for SMS operation
TAWS Fail	Momentary on ground due to poor GPS signal.	Self-clearing when airplane is moved away from structures causing interference with GPS signals.
Terrain Fail	Momentary on ground due to poor GPS signal.	Self-clearing when airplane is moved away from structures causing interference with GPS signals.

Message	Triggered By	Corrective Action
WWS Maintenance REQD	Improper signal from WWS components.	Message may remain on the entire flight or appear intermittently. Do not log for maintenance if system is operating normally.

SECTION IIIC - STATUS MESSAGES

The following white status CAS messages may appear during power up or in flight. Generally, no pilot action is required to clear the message except as noted under Corrective Action column.

Message	Triggered By	Corrective Action
APU Door Open	May appear for up to approximately 30 seconds following power up of aircraft.	None required if message clears within approximately 30 seconds following power up of aircraft.

SECTION IIID - OMS MESSAGES

The following OMS messages will be active after power up with the engines running. No action required to dispatch.

Message	Triggered By	Corrective Action
ADC1 has an internal fault	Software initialization issue	None required. Self-clearing before take off
ADC2 has an internal fault	Software initialization issue	None required. Self-clearing before take off
ATC/TCAS1 Output Bus L-TSS-XT is Disconnected / Failed	Software initialization issue	None required.
ECU 9284 FWD Heating Device Failure	Software initialization issue	None required.
G540DA51 Drain Valve 4" Heating Device Failure	Software initialization issue	None required.
HF RX/TX 1 Internal Fault Label 351/27	Software initialization issue	None required.
Pack Inlet Valve Failed Closed	Software initialization issue	None required.
PS9283_Aft Pressure Sensor Defect	Software initialization issue	None required.
PWP 9282 FWD Heating Device Failure	Software initialization issue	None required.

Message	Triggered By	Corrective Action
Reference Mesh Sensor Defect Degraded Measurement Accuracy	Software initialization issue	None required.
TA is not visible on CAN bus	Software initialization issue	None required.
WCU internal failure minor	Software initialization issue	None required.

OPERATIONAL INFORMATION SUPPLEMENT No. 5 GULFSTREAM G280 AIRPLANE G280-OIS-05 Basic Issue

MFR SERIAL No. _____

REGISTRATION No. _____

OPERATIONAL ISSUES LIST FOR ROCKWELL COLLINS PROLINE FUSION PLANEVIEW 280 AVIONICS V3.6 AND V3.6.1

This supplement provides additional procedures, techniques or information recommended for operation of the G280 aircraft under normal or abnormal conditions. This OIS contains information provided by Rockwell Collins about known flight deck issues and workarounds with the G280 V3.6 avionics software (MOD-G25-10032) and the G280 V3.6.1 avionics software (MOD G25-10074).

The information contained herein supplements the information of the Airplane Flight Manual (AFM), latest revision. For Limitations, Normal Procedures, Abnormal Procedures, Emergency Procedures and Performance information not contained in this supplement, consult the AFM, latest revision.

Date: 21 Jan 2021 Manual No._____

GULFSTREAM AEROSPACE LP

AVIONICS VERSION 3.6 AND V3.6.1 ISSUES

INTRODUCTION

GENERAL

This document provides both a list of known software issues and operational advice covering all current certifications.
The document includes restrictions, flight deck effects and suggested work around for flight operation.

FMS:

The FMS has not implemented RNP AR or RNP SAAAR Functions. The airplane is not authorized to perform RNAV (RNP) approach procedures.

Calculated landing weight and Vspeeds do not update when the same approach has been re-entered following a missed approach.

- To re-post approach Vspeeds a second time, change one of the APPROACH REF input parameters (OAT, Wind, etc), leave the APPROACH REF pages, come back to the APPROACH REF pages to post the approach speed.

FMS Constant Speed Targets (CST) function:

Continual Speed Target does not fly appropriate departure speeds when you takeoff within the arrival area of the destination airport.

- If the origin airport is within the arrival area (default 15nm) the CST mode will transfer through approach mode during the departure.
- Crew can select MAN speed for departure until out of the destination arrival area.

If the CST mode is WPT LIM speed and then the WPT causing that limit is deleted from the flight plan the CST speed limit persists.

- The WPT speed constraint can be deleted by pressing DELETE on the CDU and the selecting the left LSK next to TGT SPD on the CDU PERF page.

- Pilot can select MAN speed to stop CST WPT LIM speed command.

Autospeeds do not transition from takeoff to approach mode while on a SID or when returning to the origin airport before exiting the departure aerodrome area with the flaps up.

- Use manual speed control for return to origin APT, if within departure aerodrome or flaps are not retracted. The takeoff mode is exited after leaving the departure aerodrome and flaps are cleaned up.

If a FMS power cycle occurs while in INDEP mode, the FMS will power up in independent mode but will sync to the latest FPLN.

- Re-enter the FPLN on the power-cycled FMS if a different flight plan is desired.

When flying under the speed/altitude limit (default–250/10000), the speed limit is applied even when Long Range Cruise (LRC), Maximum Range Cruise (MRC), or Maximum Cruise (MCRZ) is the selected speed mode and is calculated to be faster or slower than the speed limit.

- Crew must use manual speed to fly desired LRC, MRC or MCRZ when under the altitude/speed limit.

CST will momentarily command the standard cruise speed before commanding RTA speed when flying RTA speeds as the aircraft levels off at the cruise altitude.

- This is a transient effect and CST will recalculate the correct RTA cruise speed once the aircraft levels off at the cruise altitude.

When an RTA is entered for a flight plan waypoint that occurs after a holding procedure, the RTA Arrival page on the CDU displays dashes and the ability to achieve the RTA is not being evaluated while in holding.

- The RTA time is continuously displayed on the lateral and the CDU legs info page. The amber or white display of the RTA readout is not evaluated during the hold.

RTA speeds are not commanded when CRZ SPD MODE on the ACT VNAV CRUISE page of the CDU is in other than SEL

- If after entering an RTA, a computed speed mode is selected or an RTA is entered while in a computed speed mode, the wrong speed is targeted, resulting in not achieving the RTA.
- Do not select a computed speed mode (LRC/MCRZ/MRC/ENDUR) when an RTA exists in the flight plan and do not enter an RTA when in a computed speed mode.

If a TO WPT exist with both a WPT speed constraint and a RTA, the speed target changes so neither goal is accomplished.

- Crew should not enter both a waypoint speed constraint and a required time of arrival on the same waypoint.

On PERF TAKEOFF REF or PERF APPROACH REF pages, the OAT entries over 70°F on the CDU display as 70°C on the ¼ format FMS Data Takeoff report page.

- Enter OAT temperature in Celsius or reference the CDU for the correct Fahrenheit temperature.
- Correct temperature is displayed on the CDU and used for FMS calculations.

Takeoff Perf Parameters Do Not Accept Meters Appropriately.

- Pressure Altitude, Obstacle Height, Level Off Altitude, Max Altitude are only displayed in feet on the Takeoff pages even when other parameters are displayed in meters.
- Manually convert those parameters into feet before entering the values.

When both sides have FMS 3 as the selected NAV source, an automatic NAV to NAV transfer will only happen on the pilot side of the cockpit.

- When FMS 3 is the selected NAV source on both sides of the cockpit, set the flight director XFR side to the pilot side as shown on the Flight Control Panel and by the arrow on the Flight Mode Annunciator on the PFDs.

- The co-pilot (non-XFR side), must manually change NAV source from FMS to NAV to intercept the Localizer course and manually change NAV source from NAV to FMS to fly the missed approach from a Localizer based approach.

The VOR info dialog box cannot be accessed while flying a VOR approach that does not include the VOR as a flight plan waypoint prior to the missed approach segment.

- All desired information required for performing the approach is available on the electronic chart.
- Graphical tuning of the VOR is still available to the crew.

If the VPA (Vertical Path Angle) for a non-Type 1 approach (localizer or other approaches with a zero VPA at the MAP or runway threshold) is manually changed, executing the clear-all button on the crossing dialog box does not clear the entered value or revert the VPA to the database value.

- Do not change the VPA of published approaches.

ISA deviation of zero is indicated in as amber within the temperature compensation dialog box.

- If the ISA deviation is zero then temperature compensation is unnecessary.

When using the GFP Reroute function started on a conditional waypoint adds the first waypoints in a reversed order when creating multiple waypoints.

- Use the CDU to modify the flight plan route from a conditional waypoint

TTG value on ROUTE PROGRESS pages of ¼ FMS Data displays has an erroneous Z after the time.

- TTG (Time To Go) are enroute times, not time of arrival in Zulu. Disregard the Z displayed after the time.

The Time-to-Go value may change continuously during GPS initialization.

- This is a transient effect that stabilizes once system is initialized.

Selecting Direct-To a history leg (previous waypoint) after entering holding on an approach will remove the holding pattern from the approach.

- The Approach must be reentered in the FMS.

Interaction between VNAV, flight plan sequencing, and approach monitor functions in response to the specific execution of some approach geometries leads to one FMS detecting that the conditions for maintaining the approach descent path have not been met. When this occurs vertical deviation is removed and a red VNV flag is displayed in place of the vertical deviation on the side couple to the FMS that has determined the approach condition was not met.

- While the VNAV is failed, the Yellow FMS miscompare annunciation is displayed near the bottom of the ADI part of the PFD. The PATH flight director mode turns yellow. The FMS No Approach message is displayed in the A1 message line and on the CDU
- This issue affects only one side of the flight deck, the crew can transfer the flight director to the opposite side of the flight deck and continue on as long as they still meet the legal requirement to continue the approach
- Depending on phase of flight reloading the approach is also an acceptable workaround to resolve the issue if it occurs.

When attempting to upload a flight plan of approximately 160 waypoints or more, the onside FMS will reset.

- Do not upload flight plans with approximately 160 waypoints or more. They must be manually entered.

When temperature compensation is selected ON, a STAR altitude constraint may be temperature compensated (STAR altitudes should not be temperature compensated, only approach procedure altitudes).

- Verify STAR altitudes in the FMS are not temperature compensated when function is selected on.
- If STAR altitude is temperature compensated, the correct altitude can be entered manually.

- If the altitude constraint is at or above, the constraint will not be violated. The aircraft will follow a steeper compensated vertical path than if the altitude was not compensated.

Saving Pilot ROUTES will save the way point WIND data too.

- Review LEG Wind after recall of a stored flight plan.

During MCRZ mode, TGT speed mode alternates between PERF LIM and MCRZ.

- Aircraft speed is correct. Ignore TGT speed when this changes intermittently.

Flyover waypoint changed to flyby when new destination is entered and down track approach removed from flight plan.

- Re-designate waypoint as flyover
- Always verify that the displayed chart matches the desired actual arrival/procedure to be flown.

When an arrival without an associated database chart is programmed into the FMS and an arrival was previously programmed that has a chart in the database, that chart will remain erroneously displayed.

- The associated menu title of the erroneously displayed chart will be incorrectly displayed in magenta, wrongly indicating it matches the arrival currently programmed in the FMS.

VNAV Path Guidance issue with Flashing FPTA: In some rare and specific cases (“T-approach with turn course reversal) of an LNAV/VNAV approach, after PATH has been armed for descent, the reference altitude (FPTA) MIGHT flash erratically and the armed Path be removed (and a message “No VNAV path” is displayed in FMS).
All other VNAV vertical deviation indications and guidance will operate normally.

- Crew shall deselect and re-select VNAV mode at the subsequent waypoint, once the desired procedure altitude has been captured.

OIS 5

CDU:

Tune by IDENT (entering the NAVAID identifier instead of the frequency) is not authorized when more than one NAVAID selection is displayed (more than one NAVAID has the same identifier). The latitude and/or longitude displayed on the SELECT NAVAID page of the CDU may be incorrect.

- If the CDU displays a choice of NAVAIDS after tuning by IDENT, return to the TUNE page and enter the NAVAID frequency instead of the identifier.

When the pilot enters a valid speed constraint at an ILS approach runway, it will not display next to the Runway Waypoint on the CDU LEGS page.

- The FMS will honor the entered speed even though it is not displayed on the CDU.
- The pilot can verify the entered speed by selecting the right CDU button associated with the runway waypoint and check the speed constraint value that appears in the scratchpad.

Flight ID character length is not consistent between TUNE and FANS/ATN pages.

- Crew should not enter a flight ID greater than seven characters.

DATA and COM are alternating in the CDU.

- Select desired mode.

No Indication of why CDU message VSPD Out Of Range is displayed.

- Confer with Gulfstream 280 Pro Line Fusion FMS OG, MESSAGES AND ANNUNCIATORS chapter.

Autopilot:

The throttles may advance to the target limit (TO/GA, CLB or CRZ setting) potentially causing an Overspeed condition when the selected AFCS/AT is changed within 5 minutes of a DCU channel being powered (would only happen if DCU fails and resets).

- If the auto throttles are not operating as expected, disengage and re-engage the Auto throttle.

The thrust mode may not change back to CRZ mode after capturing an altitude during a shallow climb.

- Manually select CRZ on the SMC-THRST page if required.

FMA changes from ALTS to ALT upon PFD failure.

- A vertical mode change is required to return to ALTS mode.

Yaw Damper Off message will come on when changing AFCS cabinets.

- Re-engage Yaw Damper.

If the preselect altitude is changed in the same moment when ALT SELECT (ALTS) is activated, ALTS will use the newly dialed in preselect altitude rather than the one that was originally intended to be captured.

- Flight crews should monitor the flight director to ensure its climb/descent guidance is as expected for the current leg. If it is commanding an unexpectedly large climb or descent, or a climb/descent that would take the aircraft beyond the expected altitude, the crew can select any other vertical mode on the FCP, such as FLC, to deactivate ALT SEL and fly toward the desired altitude

Electronic Flight Information System (EFIS):

Selecting the aircraft symbol on the map has priority over selecting other map items near the aircraft symbol.

- To select map items near the aircraft symbol, reduce the map range to maximize distance between the desired map item and the aircraft symbol.

Selection of a map symbol while the map data task menu is still displayed will cause the resultant task menu's button selections to not open the associated dialog box.

- Wait until the Map Data task menu has timed out, prior to selecting another task menu from the map.
- If this issue has already occurred the reselecting the map element will resolve the issue.

Cancel and Execute was rarely may not display after selecting DIR-TO on a full or half map.

- The flight plan edit can be achieved via the CDU or moving the cursor to a different display format and then returning.

Obstacles not selectable on the ¼ MFW map format.

- Obstacle information can be accessed on the ½ or full map formats.

Obstacles Info dialog box missing title.

TCAS targets are not displayed on a full map if the aircraft symbol is panned outside of the width of the map menu bar.

- A TCAS traffic threat will cause automatic pop-up to occur and the targets are displayed.

After Panning the MAP, the airport airspace (Class C for example) may not center appropriately over some airports.

- Select A/C Center, HDG or North on the MAP to correctly display airport airspace overlay.

IPC 2 Failure causes Chart Home Button on R DCP to not be functional.

- Use the 1/2 or 1/4 data menu on the Right SMC or the CCD on screen menus to access the chart page.

Flight Plan Target Altitude (FPTA) is displayed momentarily before TOD is reached or the FCP altitude is lowered. Transient effect.

The map elements displayed in the HSI CONFIG dialog box are removed or displayed incorrectly while one side of the cockpit has the 240 HSI format selected and the cross-side of the cockpit is on the same navigation source.

- Swap navigation sources or change HSI compass to 120 or 180 to resolve the issue.

VORs on the map can exceed the max map symbols.

- The max map symbols apply to low NAVAIDS and high NAVAIDS separately allowing for up to double the max map symbols. Decrease the max map symbols as desired.

The next FMS altitude target (FPTA) is shown to the crew on the PFDs correctly but it is not identified as being temperature compensated following a vertical discontinuity.

- The crew can either resolve the vertical discontinuity in the flight plan or continue to and level-off at the uncompensated altitude until intercepting the compensated path.

Via -To/Airways Functionality Not working via GFP.

- Use CDU FPLN page to intercept an airway.

When ATC 2 and TA/RA are selected, the HSI may display TCAS STBY.

- Selection indication is correct on MAP and on CDU-TUNE page.
- Selecting ATC 1 and then ATC 2 will correct the indication

A Lateral deviation miscompare amber flag may momentarily appear on the PFD when HSI changes annunciation from LPV ARM to LPV APPR.

- Miscompare flag clears within 2 seconds. Transition effect only. Continue approach if no flag.

SMC:

Full Chart Button on SMC Disappears upon repeated selection of the button.

- Full chart can be selected on the DU or close and reopen the menu on the SMC.

Rapidly pushing LSK 1L twice on the Weather Radar menu to change the mode from On to STBY may cause the Tilt readout to continuously toggle between two values.

- The toggling has no effect on the radar since it is in STBY
- Turning the radar back on will stop the toggling
- Pausing in Test momentarily when going to STBY from On prevents the toggling from occurring.

During system power up and initialization the SUA and CTRLD selections are not available on the SMC.

- Selections can be accomplished using the overlay selections available on the lateral maps.

FPV on SMC displays incorrect pitch during turns with a crosswind.

- During a dual AFD failure, remove the FPV from display and/or use VBars or XPointer FD

Vertical Situational Display (VSD):

VSD update rate lag may be noticed by the flight crew when the aircraft is operated outside of the flight plan or the performance specified by the Performance Data Base (PDB).

- The information presented is still accurate but may take up to 5 seconds to update.

Approach procedures that do not specifically list the runway as a leg within the NAV DB based procedure (non-precision type) do not display the runway on the lateral map or the VSD.

- These procedure leg types are by design and the FMS flight plan will operate correctly.

The VSD draws the takeoff profile based on aircraft present position for departures with non-fixed first leg type (first waypoint is conditional, i.e. waypoint is based on reaching an altitude instead of a geographical location).

- When first waypoint in flight plan is conditional, the VSD top of climb indication is not accurate while on ground until on the runway in takeoff position.

When approaching a waypoint with an altitude constraint that is higher than the current altitude, the VSD leg color and altitude constraint color on the CDU legs page may continue to be green or change between green and amber when the altitude constraint is not achievable. This scenario occurs when the preselector is limiting the planned VNAV operations.

VSD glide path representation is incorrect if the Flight Plan Destination is changed while within the FAF of an Origin Approach.

- Crew should not make edits to the flight plan destination while inside of the FAF on an LPV approach to the origin airport. If a go-around is executed the VSD removes the glide path and the issue is resolved.

Approach feathers greater than 9.5 NM in length are removed from display on the VSD during approaches when using a 1/2 map range of 1 or 2 NM.

- Increasing the map 1/2 range to 3 NM or more causes the feather to be re-displayed correctly on the VSD.

VSD Obstacles are incorrectly displayed if the obstacle distance is entered in meters.

- Obstacles are displayed correctly when obstacle distance is entered in feet. Do not enter an obstacle distance using the meters format.
- Performance calculations are performed correctly when distance is either format.

Glideslope/Glidepath intercept depicted on the VSD is lower than actual intercept when using temperature compensation.

- Navigate aircraft using the vertical deviation indicator on the PFD.

DU Radio Tuning:

Graphical VHF radio tuning on a DU2 map is sometimes unavailable. The COM FREQS and ARTCC button exists in the task menu, but selecting the button may not bring up the ARTCC dialog box.

- If radios cannot be tuned graphically, tune through the CDU or 1/4 DU Tune format.

1/4 DU Tune format Preset Frequencies list scrolls backwards.

- Crew can scroll list in the opposite direction or used CDU to tune presets.

Automatic NAV frequency tuning of a cross side radio is being attempted when only one FMS is operational, but actual radio frequency is not being changed.

- Only the one side FMS will NAV to NAV in a single FMS operation. The cross side will have to manually select FREQ and NAV SOURCE to LOC.
- DU Tune page may indicate autotune but the actual frequency will not change.

Electronic Checklist:

The Auto Synoptic Selection Defaults to OFF on power up.

The focus box around the checklist line items lags the cursor movement when stepping through the checklist. Trigger selecting on the CCD affects the line surrounded by the focus box, not the line where the cursor is.

- Before trigger selecting a checklist step, wait for the focus box to outline the desired step. Trigger selecting too quickly will deselect the previous step where the focus box is instead of selecting the step where the cursor is.

The SMC cannot select a NOTE if the focus box was moved to the note manually. When the focus box is on the NOTE, pushing select on the SMC will not advance the focus box to the next step of the checklist.

- When using the SMC to select checklist steps, always select the step prior to a NOTE so the focus box moves to the note automatically.
- Using the CCD to run the checklist instead of the SMC will avoid this issue.

ECL occasionally draws a box around a checklist item either in the 3rd or 4th row.

- Move the box to desired line item and continue to use checklist.

GWX:

The scaling of the DLGWX NEXRAD image on a map is double the scale. Result is an incorrect representation of DLGWX on lateral maps and color streaking may occur at map ranges at or greater than 150nm.

- DLGWX NEXRAD images should not be view on lateral map formats.
- DLGWX NEXRAD images can be viewed with the ¼ MFW DLGWX Format.
- When available XM NEXRAD images can be viewed on lateral maps.

DATA LINK / CPDLC FANS / Link +2000:

(Dual DATALINK Option only) When RIU2 is the active data link source, selecting DL for Data link on the CDU INDEX Menu goes to the MCDU Menu.

- Select the data link button on the MCDU Menu when it is displayed or use the DATALINK hot key on the CDU instead of the IDX hot key.

Pre-MOD G25-10074: XM GWX zoom does not operate when the CCD cursor is placed directly inside the control box.

A double press of the VERIFY prompt at LSK 5R will send the message prior to verifying it since the SEND prompt is also at LSK 5R on the verify page.

When checking CDU messages (pressing MSG hot key button) when on the CDU FANS menu page, a second selection of the MSG button does not cause a return to the FANS page.

- Manually navigate back to the desired page by selecting the ATC/ATS button on the CDU.

(Dual DATALINK Option only) Changing the selected datalink radio may set and latch the ATN ATC Alert CAS message.

- The ATN Aural will not sound when future ATN Alert messages are received if the ATN ATC Alert CAS message is latched on
- Before changing the designated DL radio, select DISABLE CPDLC on the ATN LINK STATUS page. Verify CPDLC is ENABLED on the ATN LINK STATUS page after changing the designated DL radio. Flight ID may need to be re-entered
- If the ATN ATC Alert CAS message is latched on (does not clear after all Alert messages have been viewed), visually monitor the ATN CDU page as much as possible when conducting ATN operations to watch for the ATC Alert prompt appearing next to LSK 6R. This will be the only indication of new ATC Alert messages.

OIS 5

SVS:

Pre MOD G25-10074: The magenta SVS destination runway highlight will not be displayed for an arrival programmed to the origin airport.

- When returning to origin, change the destination airport in the FMS and set the arrival to the destination airport.

The extended centerline is not displayed from the intended landing runway when flying a circling approach procedure.

- The extended centerline is drawn based on the approach programmed in the FMS, not the runway programmed for landing.

OPERATIONAL INFORMATION SUPPLEMENT No. 6 for GULFSTREAM G280 AIRPLANE G280-OIS-6

MFR SERIAL No. _____

REGISTRATION No. _____

TAKEOFF AND LANDING OPERATIONS AT ULAANBAATAR, MONGOLIA (ZMUB)

This Supplement must be attached to CAAI Approved Airplane Flight Manual for take-off and landing operations at Ulaanbaatar, Mongolia (ZMUB), runways 14 and 32 only. Information contained herein supplements information in basic Airplane Flight Manual. For limitations, procedures and performance information not contained in this Supplement, consult basic Airplane Flight Manual.

Date: 8 Feb 2018 Manual No._____

This approval is applicable to Airplane Flight Manuals of U.S. registered aircraft in accordance with provisions of FAR 21.29 and is incorporated under FAA Type Certificate No. A53NM.

GULFSTREAM AEROSPACE LP

OIS 6

TAKE-OFF AND LANDING OPERATIONS AT ULAANBAATAR, MONGOLIA (ZMUB)

GENERAL

This supplement allows take-off and landing operations at Ulaanbaatar, Mongolia, (ZMUB).

Since the overall runway slope at Ulaanbaatar airport (ZMUB) exceeds 2%, it is necessary to use a reduced take-off and landing runway length that does not exceed the AFM runway slope limitations. This supplement details the reduced runway length and performance criteria to satisfy take-off and landing operations at this airport.

The general information in the introduction section is applicable with the addition of the following:

SECTION I
LIMITATIONS

1. Landing operations at Ulaanbaatar (ZMUB) airport are limited to runway 14. Take-off operations are limited to runway 32.
2. The Transition Level at this airport is FL098 (3000 m) and the Transition Altitude is 8210 ft (2500 m).
3. The first 800 M (2625 ft) of runway 32 are at a slope of 2.5%. The remaining 2300 M (7550 ft) has an average slope of 2.0%. To avoid exceeding the maximum runway slope limitation of 2%, the first 800 M for take-off on runway 32 and the last 800 M for landing on runway 14 should not be used (see Figure Figure XI-6-1, page XI-6-5). Therefore, both take-off and landing distance performance should be based on not exceeding an available runway length of 2300 M (7550 ft).

SECTION II
EMERGENCY PROCEDURES

No change.

SECTION III
ABNORMAL PROCEDURES

No change.

SECTION IV
NORMAL PROCEDURES

No change.

SECTION V
SYSTEMS

No change.

OIS 6

SECTION VII
PERFORMANCE

TAKE-OFF REQUIREMENTS

Take-off on Runway 32 only. Runway available for take-off distance planning is 2300 M (7550 ft). Start the take-off roll 800 meters from runway 32 threshold. Use 2% downhill slope to compute take-off performance. After take-off, current published SID's require a climb rate of 207 ft/nm (3.4%) to 5250 ft MSL.

LANDING REQUIREMENTS

Land on Runway 14 only. Runway available for landing distance planning is 2300 M (7550 ft). Cross runway threshold at height of 50 ft and touchdown approximately 1000 ft from threshold. Although landing is uphill, runway slope is not to used in computing required landing distance. The last 800 meters (2625 ft) of runway should not be used for landing operations.

ULAANBAATAR, MONGOLIA - ZMUB / ULN

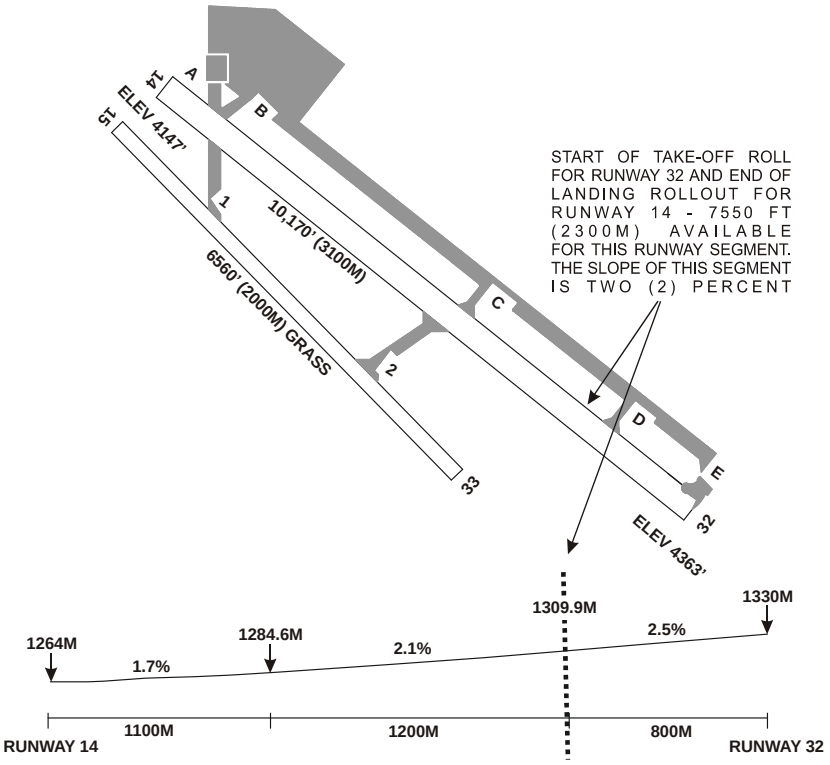

Figure XI-6-1 Ulaanbaatar Airport (ZMUB) Layout

REGISTRATION No. _____

RUNWAY CONDITION ASSESSMENT MATRIX (RCAM)

This Supplement must be attached to CAAI Approved Airplane Flight Manual. Information contained herein supplements information in basic Airplane Flight Manual. For limitations, procedures and performance information not contained in this Supplement, consult basic Airplane Flight Manual.

Date: 2 February 2020 Manual No._____

This approval is applicable to Airplane Flight Manuals of U.S. registered aircraft in accordance with provisions of FAR 21.29 and is incorporated under FAA Type Certificate No. A53NM.

GULFSTREAM AEROSPACE LP

RUNWAY CONDITION ASSESSMENT MATRIX (RCAM)

The following table provides guidance for reference material for takeoff and landing computations while complying with Takeoff And Landing Performance Assessment (TALPA) standards utilizing Runway Condition Assessment Matrix (RCAM) numerical values. If the RCAM Runway Condition Code (RwyCC) value is given, utilize the table below to locate the correct performance information in the Airplane Flight Manual or appropriate Airplane Flight Manual Supplement. Additional information can be found in the Aeronautical Information Manual, section AIM 4-3-9.

CAUTION

A RwyCC of “0” represents wet ice, slush over ice, etc. and is used to delineate a braking action of “NIL”. An RwyCC value of “0” is prohibited from being reported in a FICON NOTAM. G280 performance charts do not provide information for operations under these conditions.

Runway Condition Description	RwyCC	Pilot Reported Braking Action / Directional Control	Takeoff Performance Computation Reference	Landing Performance Computation Reference
Dry	6	N/A	AFM Section V	AFM Section V
Frost or 3mm (1/8 inch) or less of water, slush, wet snow or dry snow. Includes damp runway.	5	Good / Braking deceleration is normal for the wheel braking effort applied AND direction control is normal.	AFM Section V	AFM Section V
OAT -15°C (5°F) or colder with compacted snow	4	Good to medium / Braking deceleration OR directional control is between good and medium	AFM Supplement 8 (Compacted Snow)	AFM Supplement 8 (Compacted Snow)

Table 1: Takeoff and Landing Performance Computation References

Runway Condition Description	RwyCC	Pilot Reported Braking Action / Directional Control	Takeoff Performance Computation Reference	Landing Performance Computation Reference
Dry or wet snow over compacted snow. Compacted snow with OAT warmer than -15°C (5°F). More than 3mm (1/8 inch) of dry or wet snow. Wet runway (slippery when wet)	3	Medium / Braking deceleration is noticeably reduced for the wheel braking effort applied OR directional control is noticeably reduced	AFM Supplement 8 (Slush, Standing Water or Wet Snow; or Dry Snow)	AFM Supplement 8 (Slush, Standing Water or Wet Snow; or Dry Snow)
Greater than 3mm (1/8 inch) of water or slush	2	Medium to poor / Braking deceleration OR directional control between medium and poor	AFM Supplement 8 (Slush, Standing Water or Wet Snow)	AFM Supplement 8 (Slush, Standing Water or Wet Snow)

Table 1: Takeoff and Landing Performance Computation References (Continued)

Runway Condition Description	RwyCC	Pilot Reported Braking Action / Directional Control	Takeoff Performance Computation Reference	Landing Performance Computation Reference
Ice	1	Poor / Braking deceleration is significantly reduced for the wheel braking effort applied OR directional control is significantly reduced	AFM Supplement 8 (Ice)	AFM Supplement 8 (Ice)

	Rudder, Spoiler, Flaps, Elevator Monitor, Q-FEEL	F14	FCECU 2 CMD	28Vdc to FCECU 2 command path, lower Rudder SOV, INBD MFS SOV.	Similar to FCECU2 fail, Systems not available: Flaps Rudder – single Mid spoilers Q-feel R elevator monitor Flap/STAB sync.
	Rudder, Spoiler, Flaps, Elevator Monitor, Q-FEEL	G14	FCECU 2 MON	28Vdc to FCECU monitor path.	
	Nose Wheel Steering System	F15	NWS	28Vdc to the nosewheel steering controller and for inputs for NWS controller via pedal disconnect push batten.	Nosewheel steering is not available. Amber NWS INOP caution message comes on. The differential breaking for steering is available.
	Flaps	F16	FLAPS SOV	28Vdc to flaps primary SOV.	Primary flaps channel is not available.

RIGHT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 6 of 9)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
FGCS / HYD	Inboard Brakes Channel	G16	INBD BRKS	28Vdc to brakes inboard channel, inboard emergency line pressure transducer and Inboard accumulator pressure transducer.	Inboard braking channel is not available. No indication of available pressure in the inboard accumulator. No indication of pressure via emergency inboard line pressure transducer.
	HSTA	F17	ALTN STAB	28Vdc to alternate STAB channel, HMCU channel B, HSTA secondary motor.	Alternate STAB Fail caution message comes on for failed channel and advisory message (maintenance) for pressure transducers failure.
	Right Analog Hydraulic Pressure	G17	R HYD PRESS	28Vdc to hydraulic pressure transducer (analog)	Amber dashes appear on EICAS for analog hydraulic pressure.
	Elevator	F18	ELEV SOV R	28Vdc to R HYD elevator actuators SOV's.	The ability to shut down the hydraulic pressure elevator actuators is lost. HOPS is not available.
	Hydraulic Fire SOV	G18	R HYD SOV	28Vdc to L hydraulic fire SOV	Cannot close hydraulic fire SOV (FSOV).

RIGHT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 7 of 9)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
FGCS / HYD	Nose Landing Gear	F19	LG NOSE POS	28Vdc for all components of NOSE LG: Up-lock relays, Down-lock relays, WOW relays.	In flight (LG up and locked mechanically): 1. EICAS – FC synoptic page – NOSE LG = AMBER. 2. LG Maintenance REQD advisory message comes on as a result of NOSE GEAR FAIL INDICATION (internal bit). During landing or taxi (LG down and locked mechanically): 1. EICAS – FC synoptic page – NOSE LG = AMBER. 2. Gear Not Down caution message comes on. No indication of downlock for this LG. The following landing gear system consumers signals revert into the default relay conditions (downlock relay = LG not down and locked, uplock relay = LG not up and locked, WOW relay = A/C in flight), uplock relay – internal lights, EICAS (same as paragraph 1 above, for flight conditions) downlock relay – taxi lights, nosewheel steering, Avionics (TSS), EICAS (same as paragraph 1 above for landing and taxi conditions) WOW relays – avionics (ADS No. 2, IPC No. 1, IPC No. 2, DU No. 1, and DCP No. 1), nose wheel steering, probes, pulse lights.

RIGHT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 8 of 9)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
FGCS / HYD	RH Main Landing Gear	G19	R LG POS	28Vdc to all components of RH MLG: Uplock proximity switch, uplock relays, downlock relays, WOW relays.	In flight (LG up and locked mechanically): 1. EICAS – FC synoptic page – RH MLG = AMBER. 2. LG Maintenance REQD advisory message comes on (1) as a result of RH MLG FAIL INDICATION (internal bit). The following consumers signals revert into the default relay conditions (downlock relay = LG not down and locked, uplock relay = LG not up and locked, WOW relay = A/C in flight) uplock relay – EICAS (same as paragraph 1 above), Hydraulic system. WOW relays – Avionics (SRT, flight recorder No. 1), power (distribution, cabin), fuel system, windshield, waste system.
LTS	Emergency Lights	C11	R EMER	Feeds both Emergency Distribution Light Unit (ELDU)	If ELDU batteries are charged: 1. If both L EMER and R EMER cb's are out and the system armed, the emergency batteries will not be charged and the emergency lights will illuminate. 2. If one of the cb's is out and the system armed the batteries will be charged (no change in operation).

RIGHT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 9 of 9)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
LTS	Internal lights	C12	R INST DIM	Right console, right glareshield circuit breaker panel and switching panel.	If R INST DIM cb is out, the right console, right glareshield circuit breaker panel and switching panel lights are inoperative.
	Internal lights	B13	R SW LIGHT	Lighted switches and circuit breaker panel	Lighted switches and circuit breaker panel.
	Internal lights	B14	R DOME/MAP	Right dome light, left and right map lights, step lights and pedestal flood light	If R DOME/MAP cb is out, the right dome light, left and right map lights, step lights and pedestal flood lights are inoperative.
	External lights	C13	R TAXI/LDG CTRL	Control to right taxi light and right landing light	If R TAXI/LDG CRTL cb is out, the right taxi light and right landing light are inoperative.
	External lights	C14	PWR R TAXI/LDG	Power to right taxi light and right landing light	If PWR R TAXI/LDG cb is out, the right taxi light and right landing light are inoperative.
	External lights	C15	NAV	Forward position lights (wingtip) and aft position light	If NAV cb is out, the forward position lights (wingtip) and aft position light are inoperative.

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 1 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
ANTI-ICE	Windshield Heat	D2	L WS HT CTRL	28Vdc to left main windshield de-icing control channel.	No left main windshield de-icing.
	Windshield Heat	D3	L SIDE WDO HT	28Vdc to Left Side Window De-fog Control Channel and 28Vdc to Left Side Window De-Icing.	No Left Side Window Electrical De-fogging and De-Icing.
	Ice Detection	E4	L ICE DET	28Vdc to left ice detector.	Left Ice detection is not available.
	SAT/TAT HT	E3	SAT/TAT HT	Feed temperature sensor heat.	SAT/TAT temperature sensor heat does not operate.
	Left Pitot Heat	D4	L PITOT HT	Feed left Pitot heat left static 1 heat and right static 1 heat	Left pitot heat, left static port No. 1 heat and right static port No. 1 heat do not operate.
	AOA Control	E5	L AOA CTRL	Powers left AOA control and monitoring circuit.	AOA Probe Fail, L-R caution message comes on. the system operates properly with the second AOA sensor.
	AOA Heat	D5	L AOA HT	Power left vane heater and left case heater.	On ground: AOA Heat Fail, L advisory message comes on. in flight: advisory. In icing conditions the system ignores left AOA indication and AOA Probe Fail, R advisory message comes on.
ECS	Equipment Cooling	J1	L NOSE FAN	28Vdc to left nose equipment cooling.	No left nose equipment cooling, if needed.

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 2 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
ECS	Equipment Cooling	J2	CKPT FAN	28Vdc to FWD radio rack equipment and display cooling.	No FWD radio rack equipment and display cooling, if needed.
	Temperature Control	K5	GADC 1 MAN	28Vdc to manual circuit of cockpit temperature control (GADC II No. 1)	Loss of cockpit temperature control in manual mode.
	Oxygen Control	J5	OXY CTRL	Oxygen feed stops, passenger oxygen controller, pressure transducer.	Oxygen stops, passenger oxygen controller, pressure transducer do not operate. Bypass switch overrides the electrical system
		K1	HST 1 (O)		
		K2	HST 2 (O)		

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 3 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
COMM	Radio Management	L1	RIU1A	28Vdc to RIU No. 1 Channel A.	Loss of RIU No. 1 Channel A. Loss of data link capabilities in single data link configuration. RIU 1 Fail caution message comes on.
	SATCOM System	L2	SATCOM (I)	28Vdc to SATCOM System	Loss of SATCOM system
	HF System	K3	HF RX/TR1	28Vdc to HF No. 1 Transceiver.	Loss of HF No. 1 system HF 1 Fail advisory message comes on.
	HF System	L3	HF CPLR1	28Vdc to HF No. 1 Coupler	Loss of HF No. 1 system HF 1 Fail advisory message comes on.
	Digital Audio System	L5	ACP3 (I)	28Vdc to ACP No. 3, if installed.	If installed: Loss of ACP No. 3. ACP 3 Fail advisory message comes on.
	VHF System	L6	VHF3	28Vdc to VHF No. 3 Transceiver.	Loss of VHF No. 3 system VHF COM 1-2-3 Fail caution message comes on.
	Satellite Internet	K4	SAT HSD	28 Vdc to Swift Broadband (SBB) system.	Loss of SBB system.
NAV	DME System	M1	DME1	28Vdc to DME No. 1 System.	Loss of DME No. 1 system DME 1 Fail advisory message comes on.
	Radio Altimeter System	M2	RA 1	28Vdc to radio altimeter No. 1.	Loss of RA No. 1 system RAD ALT 1 Fail advisory message comes on. Automatic reversion to RA No. 2 if installed. Flag on PFD.

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 4 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
NAV	Weather Radar System	N2	WX	28Vdc to weather radar System.	Loss of weather radar system. WX Fail advisory message comes on. Annunciation of failure in HSI and MFW map if the WX overlay is selected.
	TCAS/ Transponder System	M3	ATC/ TCAS	28Vdc to TSS System	Loss of TCAS and ATC No. 1. ATC 1 Fail caution message comes on. Annunciation of failure in HSI and MFW map if TCAS overlay is selected.
		N3	SPARE		
		N4	SPARE		
	AHRS System	M4	AHS 3A (I)	28Vdc to IRS No. 3, if installed	If installed: IRS No. 3 still receives power from AHS-3B AHS 3 Fail advisory message comes on (secondary power failure).
	AHRS System	M5	AHS 2B	Secondary 28Vdc to AHRS No. 2.	AHRS No. 2 still gets power from AHS 2A. AHS 2-3 Fail caution message comes on (secondary power failure).
	AHRS System	M6	AHS 1A	28Vdc to AHRS No. 1.	AHRS No. 1 still gets power from AHS-1B AHS 1-3 Fail caution message comes on (secondary power failure).
	Flight Management System	N6	CDU 3	28Vdc to CDU No. 3, if installed.	Loss of CDU No. 3, if installed FMS 3 Fail advisory message comes on.

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 5 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
NAV	Integrated Processing System	M7	IPC 3	28Vdc to IPC No. 3	Loss of TAWS and FMS No. 3, if installed. IPC 3 Fail (C) advisory message comes on. Annunciation of failure in HSI and MFW map if the TAWS overlay is selected.
	VOR/ ILS System	N7	NAV 3	28Vdc to NAV No. 3, if installed	If installed: Loss of VOR/ILS No. 3. NAV 3 Fail advisory message comes on.
	XM Weather	N5	XM-WR	28Vdc to XM Weather system.	Loss of XM Weather system.
DU / AP	Autothrottle	O1	TQA	28Vdc to Throttle Quadrant Assembly	No auto throttle function,
	HUD	O2	HUD PWR 1 (O)		
	Autopilot System	O3	AP AIL SVO	28Vdc to Aileron servo.	Loss of Aileron Servo AP 1-2 Fail - AIL SRVO caution message comes on. Autopilot disengages.
	Autopilot System	O4	AP ELEV SVO	28Vdc to Elevator servo.	Loss of elevator servo AP 1-2 Fail - ELEV SRVO caution message comes on. Autopilot disengages.
		O5	SPARE		
		O6	TAIL CAM		
	EICAS	P6	DCU 1A	28Vdc to DCU1 ch A – Primary.	No effect. Pulling the cb and the DCU 1A B/U causes loss of DCU 1 channel A.
	EICAS	P7	DCU 1B	28Vdc to DCU1 CH B - Primary.	No effect. Pulling the cb and the DCU 1B B/U causes loss of DCU 1 channel B.

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 6 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
FUEL	Fuel	I3	WING INTER	Enable the wing interconnect valve operation (open and close).	Inability to activate the wing interconnect valve. The valve remain in last position (open, close or in transit).
	Primary Displays and control	O7	DU 2	28Vdc to central primary display.	Loss of central primary display CAS message. Automatic reversion of EICAS to DU1.
EPS/ APU	Battery Sys	A4	L BATT HT	Control of relay providing power to L battery heaters.	No left battery heat. Battery Cold, L caution message comes on.
FGCS / HYD	Rudder	G2	PEDAL FDBK	28Vdc to RPFA.	No feedback to pilot's pedals during rudder trim or auto thrust compensation.
	Gear Control Panel Interlock	G3	LG OVRD	28Vdc to the LG control panel interlock solenoid. The solenoid inside control panel prevents the retraction of landing gear with aircraft on the ground by inhibiting lever movement. Pressure transducer of landing gear emergency extension bottle.	Inability to move landing gear lever up (locked by solenoid) in order to retract landing gear.
	Internal Lights	C1	L EMER	Feeds both Emergency Distribution Light Units (ELDU).	If ELDU batteries charged: 1. If both L EMER and R EMER cb's out and the system armed, the emergency batteries will not be charged and the emergency lights will illuminate. 2. if one of the cb's is out and the system armed the batteries will be charged (no change in operation).

LEFT DISTRIBUTION BUS CIRCUIT BREAKERS

(Sheet 7 of 7)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
LTS	Internal Lights	C2	L INST DIM	Left console, left glareshield, pedestal	If L INST DIM cb is out, the left console, left glareshield and pedestal lights do not operate.
LTS	Internal Lights	B3	L SW LIGHT	Lighted switches and switching panel.	Lighted switches and switching panel.
	Internal Lights	C5	SIGNS	Seat belt lights and no smoke lights.	If SIGNS cb is out the seat belt lights and no smoke lights do not operate.
	External Lights	C3	PWR L TAXI / LDG	Power to left taxi light and left landing light	If PWR L TAXI/LDG cb is out the left taxi light and left landing light do not operate.
	External Lights	B4	STROBE	Forward anti collision lights (wingtip) and aft anti collision light.	If STROBE cb is out the forward anti collision lights (Wing tip) and aft anti collision Light do not operate.
	External Lights	C4	L TAXI / LDG CTRL	Controls left taxi light and left landing light.	if L TAXI/LDG CRTL cb is out the left taxi light and left landing light do not operate.

LEFT MAIN BUS CIRCUIT BREAKERS

(Sheet 1 of 2)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
ANTI-ICE	Windshield Heating	D1	L WS HT CTRL	Left side window and main windshield RCCB control.	No left main windshield de-icing and left side window electrical de-fogging.
EPS/APU	Distribution	A2	L MAIN TIE	Control of L BTC RCCB providing connection between main buses.	No connection between main buses if one generator is operative or external power supply.
	Generator System	A3	L GCU	Relevant only if pulled	Trips L GCU and L GEN cb's. No generator output voltage.
	Interior Power Supply	B1	60 HZ	Controls 60 HZ RCCB	No 60 H_Z inverter. Detection only by Synoptic.
	Distribution	B2	L DISTR	Controls L DISTR RCCB.	DISTR Bus Fail (C), L caution or advisory message comes on,

LEFT MAIN BUS CIRCUIT BREAKERS

(Sheet 2 of 2)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
FUEL	Fuel STBY Pump	H1	L PUMP CTRL	Left Pump Control – 1) Supply ground signal for ON or jettison commands by the pilot to the left HECS. 2. Provides ground signal to Left ON and NOT ARM pushbuttons lights and to the FQMC if set (the ON is pressed and the NOT ARM is not pressed). 3. Provides ground signal to the Left HECS during low pressure. 4. Provides ground signal to left NOT ARM pushbutton light during both generators failure in flight (even if NOT ARM pushbutton is pressed to ARM).	1. No electrical left STBY pump operation if pilot command ON or jettison. 2. The Left ON and NOT ARM pushbuttons do not illuminate. 3. The FQMC does not get indication of left pump ON or left pump ARM even if selected (pressed ON and NOT ARM not pressed). 4. No electrical left standby pump automatic operation during pressure drop. 5. The left NOT ARM pushbutton does not illuminate if of both generators fail in flight (even if the NOT ARM pushbutton is pressed to ARM).
INST	STBY INST	A1	STBY INT PWR	Power connection to STBY instrument battery charge.	STBY instruments battery starts depleting.

RIGHT MAIN BUS CIRCUIT BREAKERS

(Sheet 1 of 2)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
ANTI-ICE	Windshield Heating	D11	R WS HT CTRL	Right side window and main windshield RCCB control.	No right main windshield de-icing and right side window electrical de-fogging.
EPS/APU	Interior Power Supply	A11	CABIN	Control of cabin RCCB.	No Cabin bus, galley and 60H_Z. Detection only by Synoptic.
	Distribution	A12	R MAIN TIE	Control of R BTC RCCB providing connection between main buses	No connection between main buses if one generator is operative or external power supply.
	Generator System	A13	R GCU	Relevant only if pulled.	Trips R GCU and R GEN - No generator output voltage.
	Interior Power Supply	B11	GALLEY	Controls galley RCCB.	No galley. Detection only by synoptic.
	Distribution	B12	R DISTR	Controls of R DISTR RCCB.	DISTR Bus Fail (C), R caution or advisory message comes on,

RIGHT MAIN BUS CIRCUIT BREAKERS

(Sheet 2 of 2)

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
FUEL	Fuel STBY Pump	H11	R PUMP CTRL	Right pump control: 1. Provides ground signal for ON or jettison commands by the pilot to the right HECS. 2. Provides ground signal to right ON and NOT ARM pushbuttons lights and to the FQMC if ON is pressed and NOT ARM is not pressed). 3. Provides ground signal to the right HECS during low pressure. 4. Provides ground signal to right NOT ARM pushbutton light during generators failure in flight (even if NOT ARM pushbutton is pressed ARM).	1. No electrical right standby pump operation for p ON or jettison command. 2. The right ON and NOT ARM pushbuttons do not illuminate. 3. The FQMC does not get indication of right pump ON or Right pump ARM even if selected (pressed ON and not pressed NOT ARM). 4. No electrical right standby pump automatic operation if pressure drops. 5. The right NOT ARM pushbutton will not illuminate if both generators fail in flight (even if the NOT ARM pushbutton is pressed ARM).

STANDBY BUS CIRCUIT BREAKERS

SYSTEM	SUB-SYSTEM	CB	LEGEND	CB FUNCTION	RESULT OF CB OUT
SMC	SMC	P2	DSP 1	28Vdc to DSP No. 1.	Loss of pilot menu and range control on AFD's. Use CCD No. 1 instead.
	SMC	P3	DCP 1	28Vdc to DCP No. 1. Loss of left ISI and Pilot menu and range control on AFD's. Use CCD No. 1 instead	Loss of left ISI and Pilot menu and range control on AFD's. Use CCD No. 1 instead.SMC 1 Fail advisory Message comes on.
	SMC	P12	DSP 2	28Vdc to DSP No. 2.	Loss of copilot menu and range control on FAD's. Use CCD No. 2 instead.
	SMC	P13	DCP 2	28Vdc to DCP No. 2.	Loss of right ISI and pilot menu and range control on AFD's. Use CCD No. 2 instead SMC 2 Fail advisory message comes on.
STBY INST	Standby Instrument	P14	HSU	28Vdc to Magnetometer.	Loss of magnetometer Pilot can select AHRS as a sensor.
	Standby Instrument	P15	RSE	28Vdc to standby instruments.	Loss of both ISI's.
FCP	Autopilot System	P1	FCP A	28Vdc to flight control panel channel A.	AP 1-2 Fail - FCP caution Message comes on. Channel B still available.
	Autopilot System	P11	FCP B	28Vdc to flight control panel channel B.	AP 1-2 Fail - FCP caution Message comes on. Channel A still available.
