AIRPLANE FLIGHT MANUAL

Issue 1
15 Apr 2015

This Airplane Flight Manual is FAA approved for U.S. registered airplanes in accordance with the provision of CFR Section 21.29, and as required by FAA Type Certificate Data Sheet No. A61NM.

This Airplane Flight Manual is approved by the Civil Aviation Authority of Israel (CAAI) on behalf of the European Aviation Safety Agency (EASA), using the working arrangement between the CAAI and the EASA. This signature page is provided as CAAI statement of compliance with EASA requirements applicable to this project.

Customer acknowledges that the Publications contain Gulfstream's proprietary and trade secret information and that Gulfstream is the sole and exclusive owner of copyrights, trade secrets and all other intellectual property rights in the Publications, excluding any portions containing proprietary or copyrighted information belonging to Gulfstream's suppliers or other third parties. All rights are reserved, and Customer obtains no rights of ownership to Gulfstream's copyrights through this Agreement. No part of the Publications may be reproduced, used to create derivative works, stored in any retrieval system, or transmitted in any part or form by any means, whether electronic, photocopying, microfilm, microfiche, mechanical or otherwise. The Publications, if provided in CD-ROM or other electronic format, may be used only on a single computer controlled by Customer at any one time. Neither concurrent use on two or more computers nor use in a network is permitted without authorization and the payment of other license fees.

License

Gulfstream grants Customer a non-exclusive, revocable and non-transferable license to use the Publications solely for the maintenance, repair and operation of Customer-owned Gulfstream aircraft by pilots, aircraft repair stations (or foreign equivalents) with the applicable Gulfstream model included on their certificates, and maintenance technicians properly licensed by the Federal Aviation Administration (″FAA″) or other applicable foreign aviation authority. Notwithstanding the foregoing, Customer is expressly prohibited from copying, distributing or creating derivative works from the Publications (or facilitating any such actions) to support any of the following: (a) designing, reproducing or manufacturing products, materials, processes or services, including without limitation maintenance support software, manuals, or flight simulators; (b) creating, developing or deriving parts, materials or modifications; or (c) seeking FAA or other governmental or regulatory approval to perform any of the foregoing. Customer agrees not to disclose the Publications or any information and data contained therein to any third party except as expressly authorized above.

INTRODUCTION

GENERAL

This Airplane Flight Manual (AFM) has been approved by the Civil Aviation Authority of Israel (CAAI) and must be in the aircraft at all times. Part 2, is not CAAI approved but it contains essential and valuable information. The loading instructions in the Weight and Balance sections, however, are accepted by CAAI. (See FOREWORD, Section VI.) The AFM in the aircraft at the time of delivery contains information applicable only to that particular aircraft.

This issue of AFM is intended for use on aircraft which have installed the MOD G25-10032 or the associated Service Bulletin 280-31-106 complied with for the incorporation of the Avionics Suite 3.6.

This issue of AFM is intended for use on aircraft which do not have installed the MOD G25-10044 or the associated Service Bulletin 280-76-128 "ECU Hardware and FADEC Software Update V2G".

If the aircraft is not compliant to the above revert to previous issue of the Airplane Flight Manual.

Every effort is made to keep the manual current through a periodic revision service. Continual research, review conference with operating personnel, and a constant review of operations and flight test data, ensure inclusion of the latest data in the manual.

It is the responsibility of the owner/operator to ensure that this AFM is current.

(Continued)

REVISIONS

This AFM must be maintained in accordance with the Log of Effective Pages, herein. As new data and procedures are developed and approved (requiring changes, additions or deletions), appropriate, periodic revisions will be issued to all registered owners. Each revision will include a Revision Notice, describing the action to be taken, and a new Log of Effective Pages, listing all current pages.

A black, vertical, revision bar, in the outer margin of a page, indicates adjacent text has been changed, added or deleted.
A pointing finger (☞) - when used in conjunction with a revision bar - highlights the changed area of a page. When used adjacent to the page number, it indicates a new or extensively revised page; in this case, revision bars will not appear on page.

SUPPLEMENTS

A supplement need not be retained in the AFM unless it pertains to specified equipment installed and applicable to the aircraft or operation necessary for mission.

BACK

TOC Main

DEFINITIONS

NOTES, CAUTIONS and WARNINGS, used throughout this manual, are intended to emphasize specific procedures, instructions or information in general accord with the following:

NOTE : An operating procedure, technique, etc., which is considered important to emphasize.

CAUTION : An operating procedure, technique, etc., relative to safety matters of a secondary order or not immediately imminent which may result in damage to equipment if not carefully followed.

WARNING : An operating procedure, technique, etc., relative to safety matters of a primary order or immediately imminent which may result in personal injury or loss of life if not carefully followed.

LIMITATIONS

A system, component, structural or procedural limit that must be adhered to.

EMERGENCY PROCEDURES

An emergency procedure is one requiring the use of special systems and/or regular systems in order to protect the occupants and the aircraft from serious or critical harm. These procedures usually require immediate and precise action.

ABNORMAL PROCEDURES

An abnormal procedure is one requiring the use of special systems and/or the alternate use of regular systems, the use of which may be expected to maintain an acceptable level of airworthiness or reduce operational risk resulting from a failure condition.

NORMAL PROCEDURES

A normal procedure involves routine operations of a day-to-day nature. It is also concerned with peculiarities of the aircraft's design and operating features encountered in connection with routine operations, including malfunction cases not considered to be an emergency or abnormal condition (i.e., not considered to degrade or affect safety).

(Continued)

BACK

TOC Main

NOTE

The operating procedures contained in this manual have been developed with specific regard for the design features and operating characteristics of this aircraft and have been approved by the CAAI for guidance in identifying acceptable procedures for safe operation. Observance of these procedures is not intended to prohibit or discourage development and use of improved or equivalent alternate procedures based on operational experience with the aircraft. When alternate procedures are used, full responsibility for compliance with applicable airworthiness safety standards rests with the operator.

OEI	One Engine Inoperative
OEM	Original Equipment Manufacturer
OFV	OutFlow Valve
OHP	Overhead Panel
OHU	Overhead Unit
OMS	Onboard Maintenance System
OTBD or OUTBD	Outboard
OXY	Oxygen
P	
PA	Public Address
PADS	Pilot Authority Disconnect Switch, part of the ailerons/spoilers control system

ABBREVIATIONS AND ACRONYMS

(Sheet 17 of 25)

PBE	Portable Breathing Equipment
PDA	Premature Descent Alert
PDL	Pedal
PDU	Power Drive Unit, a flaps control system component
PEM	Power Environment Module. One of the Integrated Processing System Cabinets (IPC) modules
PERF	Performance
PIV	Pack Inlet Valve
PM	Protocol Manager – Part of the IPS modules software
PNR	Point of No Return
POC	Passenger Oxygen Controller
POS	Position
PPH	Pounds Per Hour
PPM	Parts per million
PREV	Previous
PROX	Proximity
PRSOV	Pressure Regulating Shutoff Valve

ABBREVIATIONS AND ACRONYMS

(Sheet 18 of 25)

PS	Ambient (static) pressure measurement – the first of a series of pressure measurement points related to engine observations
PSA	Preselect Altitude
psia	Pound(s) per Square Inch, Absolute (psi + local atmospheric pressure)
psid	Pound(s) per Square Inch, Differential (difference between two pressures, ΔP)
psig	Pound(s) per Square Inch, Gage; unit of pressure relative to atmospheric pressure at sea level
Pt	Pitot Port Pressure
PT	Pressure Transducer; Power Turbine
PTT	Push-To-Talk
PWR	Power
Q	
QTY	Quantity
R	
RA	Resolution Advisory
RAD ALT	Radar Altimeter
RADS	Roll Assist Disconnect Switch
RAIM	Receiver Autonomous Integrity Monitoring

ABBREVIATIONS AND ACRONYMS

(Sheet 19 of 25)

LOG OF MODIFICATIONS

Aircraft modification (MOD) numbers which affect the operation of certain airplanes or subsystems, are listed below. Text and procedures affected by these MODs are identified by the respective MOD numbers appearing in the margin of each affected page, adjacent to the applicable text.

NOTE

It is the pilot's responsibility to check this list and the airplane log to determine MOD applicability.

LOG OF MODIFICATIONS

1-00-00: GENERAL

1-00-10: CONDITIONS OF OPERATION

THE OPERATIONAL LIMITATIONS ARE PART OF THE CONDITIONS OF THE TYPE CERTIFICATE AND AIRWORTHINESS CERTIFICATE, AND MUST BE COMPLIED WITH AT ALL TIMES, IRRESPECTIVE OF THE TYPE OF OPERATION BEING CONDUCTED.

THE PERFORMANCE LIMITATIONS AND THE INFORMATION PRESENTED IN THE AIRPLANE FLIGHT MANUAL SHOW COMPLIANCE WITH CIVIL AVIATION AUTHORITY REGULATION.

THIS AIRPLANE IS TO BE OPERATED IN ACCORDANCE WITH THE LOADING SCHEDULE PROVIDED IN THE WEIGHT AND BALANCE SECTIONS.

1-01-00: AIRCREW AND OCCUPANTS

1-01-10: MINIMUM FLIGHT CREW

Minimum flight crew required is pilot and copilot.

1-01-20: MAXIMUM NUMBER OF OCCUPANTS

19 Maximum - limited by emergency exit requirements. Carriage of passengers is permitted only when an approved seating arrangement is installed and compliance has been demonstrated to all passenger-related regulations.

1-02-00: DEPARTURE / ARRIVAL AIRPORT

1-02-10: RUNWAY, SLOPE, AND WIND CONDITIONS

SLOPE

Maximum slope approved for takeoff and landing operations are +2% (uphill) and -2% (downhill).

WIND CONDITIONS

Maximum tailwind component approved for takeoff and landing is 10 knots.

For demonstrated crosswind, see DEMONSTRATED CROSSWIND, page V-5-13.

CONTAMINATED RUNWAYS

For Contaminated Runway Operations, see Contaminated Runway Operations, page X-8-1.

1-02-20: HIGH ELEVATION AIRPORT OPERATIONS

Maximum approved airport pressure altitude for takeoff or landing is 10,000 ft field elevation.

1-03-00: PERFORMANCE

1-03-10: TYPES OF AIRPLANE OPERATIONS PERMITTED

1. Transport category - land.
2. Instrument and night flying.
3. Category 1 and 2 approach operations.
4. Flight into known icing.
5. Extended overwater flight.
6. Required Navigation Performance 10 (RNP-10) operations.
7. Basic RNAV (BRNAV or RNAV 5) operations.
8. Remote Oceanic Required Navigation Performance 4 (RNP-4) operations.
9. Precision RNAV (P-RNAV) or Required Navigation Performance 1 (RNAV 1) Operations.
10. RNAV 2 / RNAV 1 operations as defined in FAA Advisory Circular (AC) 90-100A.
11. Flight within North Atlantic Track-Minimum Navigation Performance Specifications (NAT-MNPS) Airspace In accordance with the criteria of AC 91-49 and AC 120-33, provided at least two FMSs are operating and receiving usable data from any combination of two GPSs and/or Inertial Reference Sensors (IRSs), or one FMS and one GPS and/or IRS for those routes requiring only one Long Range Navigation (LRN) sensor.
12. RNP 0.3 RNAV approaches.
13. Airplane complies with RNP RNAV as defined in RTCA / DO-236B and DO-283.
14. RNAV approaches to localizer performance with Vertical Guidance (LPV) minima.
15. Reduced Vertical Separation Minimums (RVSM) airspace operations. This does not constitute operational approval.
16. Extended Squitter transmission has been demonstrated for proper operation per EASA AMC 20-24 for broadcast of ADS-B (DO-260A) related position information.
17. Radius-to-fix legs.

1-03-20: MINIMUM / MAXIMUM OPERATING TEMPERATURE

The operator shall comply with COLD WEATHER OPERATIONS starting on page IV-87 any time the airplane has been exposed to temperatures colder than -20°C on the ground for more than 10 hours. Maximum temperature on ground is ISA+35°C. See Figure 5-32, Approved Altitude/Temperature Envelope, page V- 90.

1-03-30: OPERATING ALTITUDES

OPERATING ALTITUDE

Maximum operating altitude is 45,000 ft
Minimum operating altitude is -1400 ft

LANDING GEAR EXTENDED / OPERATION

Maximum operating altitude for extending landing gear or flying with landing gear extended is 20,000 ft MSL

FLAPS EXTENDED:

Maximum operating altitude for extending flaps or flying with flaps extended is 20,000 ft MSL

1-03-40: AIRSPEED LIMITATIONS

FLAPS EXTENDED SPEEDS (V_{FE})

10°	-	250 KIAS
20°	-	220 KIAS
LND	-	180 KIAS

MINIMUM CONTROL SPEEDS (V_{MC}); ISA; SEA LEVEL

Minimum control speed air (V_{MCA})	-	98 KIAS at flap configuration 10° and 20°
Minimum control speed landing (V_{MCL})	-	98 KIAS at flap configuration 10°, 20° and LND
Minimum control speed ground (V_{MCG})	-	95 KIAS at flap configuration 10° and 20°

For V_{MC} variations with altitude and temperature, see 5-33, page V-91 and 5-35, page V-93.

NOTE

Minimum control speeds VMCA, VMCL and VMCG in Flap 0° configuration (abnormal configuration for takeoff and landing) was not established since it is lower than the airspeed at Stick Pusher activation in this configuration and is never a limiting factor for selection of takeoff and landing speeds.

MANEUVERING SPEED (V_A)

Maximum deflection of flight controls, as well as maneuvers that involve angles of attack near the stall AOA, should be confined to speeds as follows:

S.L to 20,000 ft	-	215-225 KIAS
20,000 to 35,000 ft	-	225-264 KIAS
35,000 to 39,000 ft	-	264 KIAS
39,000 to 45,000 ft	-	0.85 M_i

(Continued)

Avoid rapid and large alternating control inputs, especially in combination with large changes in pitch, roll, or yaw (e.g., large sideslip angles), as they may result in structural failures at any speed, including below VA.

LANDING GEAR OPERATION SPEEDS (V_{LO})

Normal Operation:

Do not lower or raise landing gear at speeds in excess of 195 KIAS.

LANDING GEAR EXTENDED SPEED (VLE):

Do not exceed 195 KIAS with landing gear extended (gear doors open or closed).

EMERGENCY LANDING GEAR EXTENSION

Do not extend the landing gear utilizing the emergency system at speeds in excess of 175 KIAS.

After landing gear is down and locked, speed can be increased up to 195 KIAS.

MAXIMUM TIRE SPEED:

Maximum main landing gear tire ground speed is 195 kt.

Maximum nose landing gear tire ground speed is 182 kt.

TURBULENCE PENETRATION SPEED (V_{RA})

S.L. to 13,000 ft	-	230 KIAS
13,000 to 20,000 ft	-	250 KIAS
20,000 to 35,000 ft	-	270 KIAS
35,000 to 45,000ft	-	0.80 M_i

MINIMUM HOLDING SPEED

The minimum holding speed in icing conditions is 185 KIAS.

For optimal holding speed, see Section VIII - Operational Planning Manual.

YAW DAMPER INOPERATIVE SPEED

Maximum speed	-	250 KIAS
Maximum altitude	-	25,000 ft

MACH TRIM INOPERATIVE SPEED

With Mach trim functions inoperative, the maximum operating limit speed is 340 KIAS / 0.77 M_i.

ALTERNATE STABILIZER TRIM

See 1-27-11: MACH TRIM FUNCTION, page I-19

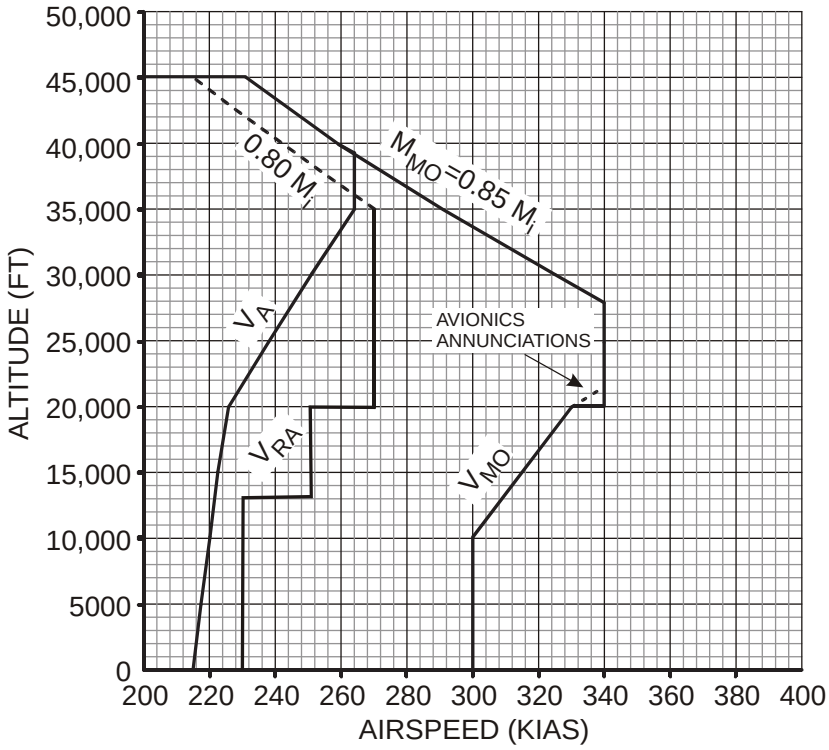
M_{MO} = 0.77 M_i

MAXIMUM OPERATING LIMIT SPEED (VMO / MMO)

Maximum operating limit speed shall not be deliberately exceeded in any regime of flight (climb, cruise, or descent).

See Figure 1-1, page I-9

S.L to 10,000ft	-	300 KCAS
10,000 to 20000	-	300-330 KCAS
20,000 to 28,000	-	340 KCAS
28,000 to 45,000	-	0.85 M_i



NOTE

V_{MO}/M_{MO} is annunciated on PFD and aural clacker.

Figure 1-1. Airspeed Limits

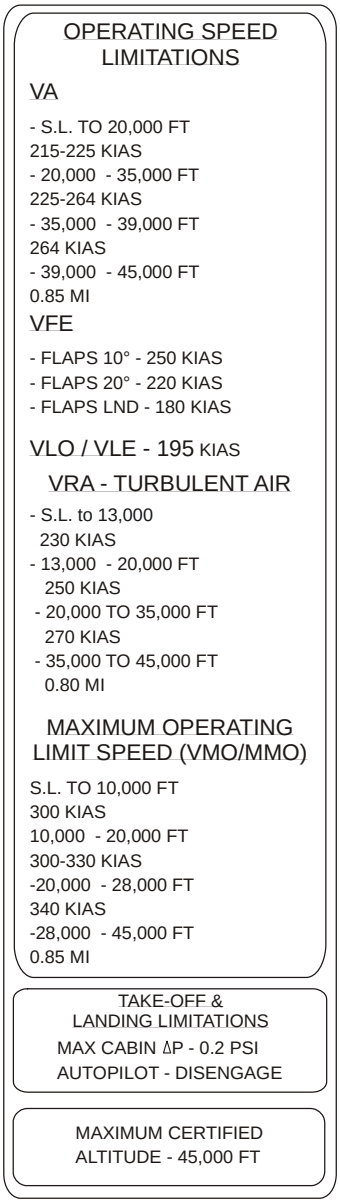


Figure 1-2. Placards

1-03-50: MANEUVERING FLIGHT LOAD FACTORS

Flaps up: -1.0 G to 2.6 G for all weights up to maximum takeoff weight.
Flaps down: 0.0 G to 2.0 G for all weights up to maximum takeoff weight

1-03-60: WEIGHTS

	Maximum certificated	
	lb	**kg**
Zero Fuel	28,200	12,791
Landing	32,700	14,833
Takeoff	39,600	17,962
Ramp	39,750	18,030
Min. Flight	23,000	10,433

NOTE

1. Maximum takeoff weight, unless restricted by climb performance, brake energy, or tire speed for approved altitudes and ambient temperature or by field length.
2. Maximum landing weight, unless restricted by climb requirements.

BAGGAGE COMPARTMENT LOADING:

Maximum 1980 lb / 900 kg
Floor load 120 lb/ft^2 / 615 kg/m^2

1-03-70: CENTER OF GRAVITY

The allowable Center of Gravity (CG) range is a function of weight as shown in the zero fuel weight center of gravity envelope chart that follows. Zero fuel weight CG must be within the allowable zero fuel weight CG envelope. The fueled airplane CG will then be within limits for all fuel loads.

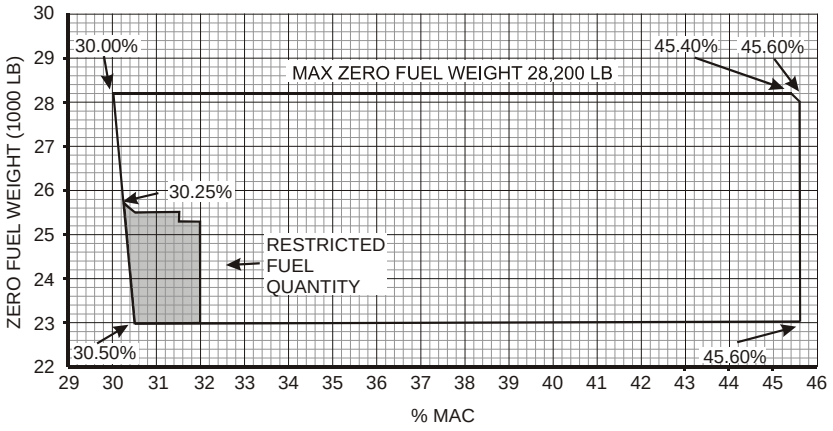

Figure 1-3. Zero Fuel Weight (ZFW) Envelope

Aft CG limit for ground handling during any stage of ground handling operations is 50% MAC.

1-03-80: FUEL LOAD BALANCING

Maximum wing fuel imbalance for takeoff is 450 lb / 204 kg
Maximum wing fuel imbalance in flight, approach and landing is 900 lb / 408 kg.

1-12-00: AIRCRAFT SERVICING

1-12-10: HYDRAULIC FLUIDS

Preferred fluid: SKYDROL LD IV - Monsanto Co.
Hydraulic fluids conforming to the G280 Aircraft Maintenance Manual:
Fluid: Fire Resistance Phosphate Ester SAE1421 type IV class 1.

1-21-00: AIR CONDITIONING AND BLEED AIR

1-21-10: CABIN PRESSURIZATION CONTROL

Maximum cabin pressure differential permitted is 9.2 psi.
Maximum cabin pressure differential permitted for taxi, takeoff or landing is 0.2 psi.

1-21-20: INTERNAL BAGGAGE DOOR

Pre MOD G25-10066

Internal baggage door must be closed during taxi, takeoff and landing. In flight, access to the baggage compartment above 40,000 ft is prohibited except by flight crew members for emergency purposes only.

Post MOD G25-10066

Internal baggage door must be closed during taxi, takeoff and landing. In flight, access to the baggage compartment above 44,000 ft is prohibited except by flight crew members for emergency purposes only

1-22-00: AUTO FLIGHT

1-22-30: AUTOPILOT

Minimum engage height is 200 ft.
Minimum disengage height is 80 ft for approaches with vertical guidance (ILS and LPV; LNAV when VNAV is used, Post MOD G25-10074 - LP when VNAV is used.)
Minimum disengage height is 50 ft below MDA for approaches with lateral guidance only.
Maximum demonstrated altitude loss for coupled go-around is 61 ft.
CAT II operation is not approved for single engine operations

1-24-00: ELECTRICAL POWER

1-24-10: ENGINE GENERATOR LIMITATIONS

Ground and flight operations - 100% maximum continuous

1-24-20: APU STARTER/GENERATOR LIMITATIONS

Ground and flight operations - 100% maximum continuous

1-24-30: BATTERY LIMITATIONS

Maximum indicated battery charge current for takeoff:
APU GEN Available: 20A
APU GEN Unavailable: 8A

NOTE

APU Generator available means it is operable, if needed, and not deferred per MEL. The APU does not have to be running to be considered available.

1-27-00: FLIGHT CONTROL SYSTEM (FCS)

1-27-11: MACH TRIM FUNCTION

If Mach trim is inoperative:
M_{MO} is reduced to 0.77 M_i.

1-27-20: TAKEOFF FLAPS SETTING

The selected takeoff flaps setting must be confirmed by both pilots as the takeoff flaps setting for which takeoff performance has been calculated.

WARNING

FAILURE TO VERIFY THE FLAP SETTING FOR TAKEOFF MAY RESULT IN TAKEOFF ROTATION AT AN INCORRECT V_R SPEED WITH POTENTIAL LOSS OF CONTROLLED FLIGHT.

1-28-00: FUEL

1-28-10: USABLE FUEL CAPACITIES

The usable fuel capacities are:

Total usable fuel volume	2179.1 US gallons	8248.5 liters
Total usable fuel weight	14,620 lb at 6.7 lb/US gallon	6631.5 kg at 0.8028 kg/liter
Total usable fuel weight when gravity refueling	9,760 lb at 6.7 lb/US gallon	4,427 kg at 0.8028 kg/liter

NOTE

Gravity refueling only fills the wing and feed tanks and can take a significantly longer time.

1-28-20: FUEL TANK TEMPERATURE

Flight is prohibited when indicated fuel tank temperature is outside the minimum or maximum specified below:

Fuel Type	Minimum Temperature	Maximum Temperature
Jet A	-38°C	57°C
Jet A-1 and JP8	-46°C	57°C

1-29-00: HYDRAULICS

1-29-10: HYDRAULIC SERVICING

Left and right brake accumulator pre-charge pressure:
700 ± 30 psi @ 70°F/21°C ± 25 psi for each increment of 10°F/5°C

Emergency gear bottle pre-charge pressure:
2600 psi to 3000 psi @ 70°F/21°C ± 25 for each increment of 10°F/5°C

1-29-20: HYDRAULIC PRESSURE LIMITATIONS

Normal operation	-	2700 to 3250 psi
Maximum	-	3500 psi

1-29-30: HYDRAULIC TEMPERATURE LIMITATIONS

Maximum hydraulic temperature	-	95°C

Electrical Motor Pump (EMP) operation above 39,000 ft is limited to 10 minutes.

1-30-00: ICE AND RAIN PROTECTION

1-30-10: GENERAL

Icing conditions exist when Static Air Temperature (SAT) on the ground or Total Air Temperature (TAT) in flight is 10°C or below and SAT is above -40°C and visible moisture is present in any form (such as clouds, fog with visibility of one mile or less, rain, snow, sleet and ice crystals). The use of wing anti-ice above 10°C TAT or below -40°C SAT is not recommended.

The use of nacelle anti-ice when SAT on the ground or TAT in flight is above 10°C (50°F) or SAT is below -40°C (-40°F) is not recommended.

Icing conditions also exist when the SAT on the ground and for takeoff is 10°C (50°F) or below when operating on ramps, taxiways or runways where surface snow, ice, standing water, or slush may be ingested by the engines or freeze on engines, nacelles, or engine sensor probes. Takeoff is prohibited with frost, ice, snow, or slush adhering to the wings, horizontal and vertical stabilizer, control surfaces, engine inlets, or other critical surfaces (top of the fuselage as well should be clean may accrete a lot of ice).

A visual and tactile (hand on surface) check of the wing leading edge and the wing upper surface must be performed to ensure the wing is free from frost, ice, snow, or slush when the outside air temperature is less than 10°C (50°F), or if it cannot be ascertained that the wing fuel temperature is above 0°C (32°F) and if any of the following conditions exist:

- There is visible moisture (rain, drizzle, sleet, snow, fog, etc.) present
- Water is present on the wing
- The difference between the dew point and the outside air temperature is 3°C (5°F) or less
- The atmospheric conditions have been conducive to frost formation
- When frost or ice is present on lower surface of either wing
- After completion of de-icing

(Continued)

The ice detectors are primary except during takeoff, approach and landing.

1-30-20: WING ANTI-ICING

Operation of wing anti-icing is required if icing conditions are imminent, or immediately upon detection of ice formation on wings, winglets or windshield edges. The icing envelope is defined as +10°C TAT to -40°C SAT with visible moisture present. The use of wing anti-ice above 10°C TAT or below -40°C SAT is not recommended.

Operation of Wing Anti Ice system above 26,000 ft with a single bleed source is prohibited

TAKEOFF INTO KNOWN OR FORECAST ICING CONDITIONS

Wing anti-ice must be on for takeoff if in icing conditions or icing conditions are anticipated.

WARNING

MINUTE AMOUNTS OF ICE OR OTHER CONTAMINATION ON THE LEADING EDGES OR WING UPPER SURFACES CAN RESULT IN A STALL WITHOUT WARNING, LEADING TO LOSS OF CONTROL ON TAKEOFF.

1-30-21: PROBE HEAT

Probe Heat operation in OVRD mode on ground for more than 30 seconds is prohibited.

1-30-30: ENGINE ANTI ICE

Engine anti ice is required for taxi and takeoff when Static Air Temperature (SAT) on the ground or Total Air Temperature (TAT) in flight is 10°C (50°F) or below and SAT is above -40°C and visible moisture in any form is present such as clouds, fog with visibility of one mile or less, rain, snow, sleet and ice crystals.

The use of engine anti-ice when SAT on the ground or TAT in flight is above 10°C (50°F) or SAT is below -40°C (-40°F) is not recommended.

1-30-40: USE OF FLAPS

Use of flaps in icing conditions is restricted to takeoff, approach and landing only.

Holding in icing conditions is limited to 0° flaps only.

1-31-00: INDICATION AND RECORDING SYSTEMS

1-31-10: CAS AURAL INHIBIT

The use of CAS aural inhibit to disable CAS aural alert is prohibited unless called for through specific AFM abnormal procedure related to failure of the crew alerting system itself.

1-31-20: UNIVERSAL SERIAL BUS (USB) DATA LOADING

1. Access to universal serial bus (USB) data loading port is limited to flight crew and other authorized personnel only.
2. USB port data loading actions limited to dedicated computer(s) that are isolated from the internet, and dedicated USB memory stick(s).

1-34-00: NAVIGATION

1-34-41: RADIO ALTIMETER

Radio Altimeter Flight Restrictions
(Required by FAA AD 2021-23-12)

When operating in U.S. airspace, the following operations requiring radio altimeter are prohibited in the presence of 5G C-Band wireless broadband interference as identified by NOTAM (NOTAMs will be issued to state the specific airports where the radio altimeter is unreliable due to the presence of 5G C-Band wireless broadband interference):

- Instrument Landing System (ILS) Instrument Approach Procedures (IAP) SA CAT I, SA CAT II, CAT II and CAT III
- Required Navigation Performance (RNP) Procedures with Authorization Required (AR), RNP AR IAP
- Automatic Landing operations
- Manual Flight Control Guidance System operations to landing / head-up display (HUD) to touchdown operation
- Use of Enhanced Flight Vision System (EFVS) to touchdown under 14 CFR 91.176(a)

1-34-43: TERRAIN AWARENESS WARNING SYSTEM (TAWS)

NOTE

Obstacles that are less than 1000 ft AGL are not displayed as obstacle symbols on the MAP display. These obstacles are included as part of the terrain display.

The terrain awareness display feature shall be selected OFF (TERRAIN INHIBIT switch - ON) when within 15 nm of landing at an airport when:

- The airport has no published instrument approach procedure
- The longest runway is less than 3500 ft in length
- The airport is not in the database

- QFE altimeter settings are used for approach and landing on subsequent takeoff without the availability of geometric altitude

1-34-60: FLIGHT MANAGEMENT SYSTEM (FMS)

Vspeeds and performance data is advisory and must be verified against the performance data contained in Section V - Performance.

The flight crew is required to verify FMS calculated takeoff and landing weights before posting the VSpeeds using the SMC display for fuel quantity data.

FMS Holding Entry (Pre MOD G25-10074)

When entering a holding pattern via a direct entry that requires greater than 180 degrees of turn, select the Heading mode (HDG) immediately after sequencing the hold fix to turn to the outbound leg. Once established on the outbound leg, FMS lateral guidance (LNAV) can be re-selected.

FMS Holding Exit (Pre MOD G25-10074)

When exiting a hold with a course reversal that is not part of a published procedure the aircraft may turn in a direction opposite the turning arrow. Therefore, pilot is required to monitor the turning direction of the aircraft or manually fly the turn after the exit.

APPR Mode for LOC approaches:

APPR mode for LOC approaches should be selected only when within 60° of approach course. See SUPPLEMENT No. 4 for more FMS limitations.

ETP (Equal Time Point Function) (Pre MOD G25-10074)

Use of ETP function in the FMS for calculation of the Equal Time Point is prohibited.

FMS Datalink Flight Plans

Do not send a FPLN RECALL request in flight within 10 NM of the TO waypoint.

Do not select INSERT MOD for a FANS flight plan uplink while the TO waypoint is flashing during waypoint sequencing.

1-34-130: ELECTRONIC CHECKLIST

Electronic checklist normal procedures only are approved for operational use.

1-35-00: OXYGEN SYSTEM

1-35-10: OXYGEN SYSTEM

The following airplane certification requirements are in addition to the requirements of applicable operating rules. The most restrictive requirements (certification or operating) must be observed.

Hats and “earmuff” type headsets must be removed prior to donning crew oxygen masks.

NOTE

1. Headsets and eyeglasses worn by crew members may interfere with quick-donning capabilities.
2. Crew and passenger oxygen masks are not approved for use above 40,000 ft cabin altitude.

WARNING

PROLONGED OPERATION ABOVE 25,000 FT CABIN ALTITUDE WITH PASSENGERS ON BOARD IS NOT RECOMMENDED.

1-45-00: ENGINE INSTRUMENTS AND CREW ALERTING SYSTEM (EICAS)

1-45-00: OMS

Operation of OMS (Onboard Maintenance System) in flight is limited to altitudes at or above 10,000 ft.

1-45-10: GENERAL EICAS RANGE MARKINGS COLORS

Normal range values:	-	white
Caution range values: amber	-	inverse video
Warning range values: red	-	inverse video

1-45-20: POWERPLANT EICAS INDICATIONS

See values in: 1-71-00: POWERPLANT, page I-1-33

Normal range values:	-	white
Caution range values: amber	-	inverse video
Warning range values: red	-	inverse video

1-45-30: FUEL EICAS INDICATIONS

FUEL TANK TEMPERATURE INDICATIONS

See values in: 1-73-00: ENGINE FUEL AND CONTROL SYSTEMS, page I-1-35

Normal range values:	-	white
Abnormal values	-	inverse video
Low temperature	-	amber

1-45-40: APU EICAS INDICATIONS

APU RPM

106% and above:	-	red digits
104% to 105%:	-	amber digits
0% to 103%:	-	white digits

1-45-50: CAS MESSAGES

Amber CAS messages are normally DO NOT DISPATCH messages as the systems that generate these messages are required for flight. Cyan maintenance messages allow dispatch as the systems that generate these messages are fault tolerant. Referencing to the AFM procedure may provide a solution to the system problem, but if any message remains, reference the MEL for dispatch.

1-49-00: AUXILIARY POWER UNIT (APU)

1-49-10: APU OPERATION

The APU can be operated on the ground, during takeoff, in flight and during landing. In flight, it is an essential source of electrical power through the APU generator.

1. Maximum altitude for APU start is 35,000 ft
2. Maximum altitude for APU operation is 40,000 ft
3. Do not operate APU if right fire extinguisher has been activated
4. APU is approved for unattended operations
5. Allow 2 minutes cooldown periods between APU starts or between shutdown and next APU start. After 3 consecutive starts, allow 30 minutes cool down period
6. Operate APU only if right standby fuel pump is operative or right engine is operative
7. Approved fuels - (same as main engine)
8. Approved oils - (same as main engine)
9. When ground aircraft de-icing is in progress, APU must be off with door closed
10. Maximum altitude for APU bleed air use is 20,000 ft

APU GENERATOR LOAD LIMITS

On ground and In flight	-	100%

MAXIMUM PERMISSIBLE EGT

Start	-	See note below
Running	-	718°C
Bleed air in use	-	666°C

MAXIMUM ROTOR SPEED

All conditions	-	108%

NOTE

Maximum transient EGT during APU start, below 50% RPM is 974°C.

1-71-00: POWERPLANT

Manufacturer	No. of Engines	Model & Type	Takeoff and Maximum Continuous Thrust Rating, Static, ISA
Honeywell	2	(HTF7250G) AS-907-2-1G	Maximum Continuous - 7240 lb Takeoff - 7624 lb

1-71-10: ENGINE GROUND START

Maximum crosswind component for engine start - 20 kt
Maximum tailwind component for engine start - 15 kt

Maximum ITT during ground start:
N_2 at or below 40% - 650°C
N_2 above 40% - 950°C

1-71-20: ENGINE GROUND OPERATIONS

N_1 is limited to 50% if tailwind component is more than 15 kt.
Note that when motoring is required, it shall commence within 3 minutes after shutdown is commanded (fuel control switch to STOP).

If landing with use of thrust reversers causes ITT to exceed limits, see ENGINE MOTORING IN HOT WEATHER CONDITIONS (PRE MOD G25-20113), page IV-65

1-71-30: ENGINE IN FLIGHT OPERATIONS

Maximum N_1, N_2 and ITT values:

	Max Continuous	TO	APR	Transient (20 sec. max)
N_1 [%]	96.5	96.8	96.8	98.0
N_2 [%]	98.0	98.0	98.5	99.9
ITT [°C]	950	955	955	970

Takeoff thrust is limited to 5 minutes with all engines operating (AEO). APR is limited to 10 minutes with an inoperative engine (OEI).

Any APR or MPR activation must be logged for maintenance.

1-73-00: ENGINE FUEL AND CONTROL SYSTEMS

1-73-10: ENGINE FUEL TEMPERATURE

Minimum fuel temperature at the fuel filter is 3°C.

1-73-20: PRIMARY ACCEPTABLE FUEL TYPES

(Sheet 1 of 2)

Organization or Country	Specification and Type or Grade			
	Jet A	**Jet A-1**	**JP-8***	**JP-5***
Honeywell	EMS53111, Type A	EMS53112, Type A-1	EMS53112, Grade JP-8	EMS53116, Grade JP-5
U.S. Military			MIL-DTL-83133, Grade JP-8	MIL-DTL-5624, Grade JP-5
U.S. Commercial	ASTM D1655, Grade Jet A	ASTM D1655, Grade Jet A-1		
International Air Transport Association (IATA)	Guidance Material, Grade Jet A	Guidance Material, Grade Jet A-1		
Joint Fueling Inspection Group		Bulletin 19, (AFQRJOS) Issued October 24, 2008, Grade Jet A-1

United Kingdom		DEF STAN 91-91, Grade Jet A-1	DEF STAN 91- 87, Grade F-34	DEF STAN 91- 86, Grade F-44
France		A. 3405, or DCSEA 134/C, Grade F-35**	AIR 3405. or DCSEA 134/C, Grade F-34	AIR. 3404. or DCSEA 144/B, Grade F-44

1-73-20: PRIMARY ACCEPTABLE FUEL TYPES

(Sheet 2 of 2)

Organization or Country	Specification and Type or Grade			
	Jet A	**Jet A-1**	**JP-8***	**JP-5***
Russia		GOST R 52050-2006 Grade Jet A-1		
Brazil		CN.78-QAV-1 Grade Jet A-1		
China (PRC)		GB6537-2006, No. 3 Jet Fuel		
North Atlantic Treaty Organization (NATO) Code		F-35**	F-34	F-44

* With fuel system icing inhibitor.
** Without fuel system icing inhibitor.

NOTE

Use of the thermal stability improver additive is approved for all Honeywell engines. Therefore JP-8+100 per MIL-DTL-83133 (NATO Code F-37) is also a primary acceptable fuel. Likewise, thermal stability additives can be added to all listed primary, alternate, or other acceptable fuels at the concentration listed herein.

1-73-22: OTHER ACCEPTABLE TYPE FUELS

Organization or Country	Specification and Grade Low-Flash-Point. Low-Freeze-Point Kerosene
Russia (CIS)	IGOST 10227-86, Grades TS-1 and RT
IATA	Guidance Material, Grade TS-1
Ukraine	GSTU 320.00149943.011-99 Grade TS-1
Ukraine	GSTU 320.00149943.007-97 Grade RT

Sustainable Aviation Fuel

Aviation turbine fuel containing synthesized hydrocarbons, also commonly known as Sustainable Aviation Fuel (SAF), manufactured, certified, and released to all the requirements of Table 1 of ASTM D7566 as well as the applicable Annexes therein, meets the requirements of ASTM D1655 and shall be regarded as Specification D1655 turbine fuel, fully fungible with all other D1655 turbine fuel. When ASTM D7566 jet fuels are re-identified as ASTM D1655 fuel, they meet all the specification requirements of ASTM D1655 fuel and are therefore approved for use.

1-73-30: ANTI-STATIC ADDITIVES

Brand	Comments	Concentration
STADIS 450 (a), (b), (c)	Total accumulated at manufacture Cumulative total when redoping	5 mg/L* maximum 5 mg/L* maximum
Sigbol [Russian (CIS)]	Total accumulated percent by weight	0.0005% maximum

NOTE

a. Automatically blended into JP-4 and JP-8.
b. Although some major manufacturers of civil aviation fuels automatically blend this additive, it is not required by the ASTM D1655 specification for Jet A, Jet A-1 or Jet B.
c. If an anti-static additive is used, electrical conductivity will conform to the requirements in the applicable fuel specification or the following values:
   1. EMS53112 Jet A-1: 50 to 450 pS/M; JP-8: 200 to 600 pS/M
   2. EMS53111 Jet A: 50 to 450 pS/M
   3. EMS53113 Jet B: 50 to 450 pS/M; JP-4: 200 to 600 pS/M

* 5 mg/L is equivalent to 5 PPM

1-73-40: EGME-BASED FUEL ICING INHIBITORS

EGME-Based Fuel Icing Inhibitors*	Concentration Percent by Volume
MIL-DTL-27686	0.10 to 0.15
AL-31 per DERD 2451	0.10 to 0.15
NATO Code S-748	0.10 to 0.15
Methyl Cellosolve	0.10 to 0.15

* By raising the fuel temperature above 0°C. The fuel heater ensures that the engine fuel system will not be affected by ice accumulation whenever the oil temperature is above 27°C.

1-73-50: DiEGME-BASED FUEL ICING INHIBITORS

Diethylene Glycol Monomethyl Ether (DiEGME) Based Fuel Icing Inhibitors	Concentration Percent by Volume
ASTM D4171, Type III	0.10 to 0.15
MIL-DTL-85470*	0.10 to 0.15
AL-41 per DEF STAN 68-252 (DERD 2451)	0.10 to 0.15
NATO Code S-1745	0.10 to 0.15
Prist (PPG) Hi-Flash A/I**	0.10 to 0.15

* Automatically blended into military JP-1. JP-5. and JP-8 fuel.

** Manufactured by Prist Aerospace Products under the name of “Prist Hi-Flash”.

1-73-60: RUSSIAN (CIS) FUEL SYSTEM ICING INHIBITORS

Russian (CIS) Fuel System Icing Inhibitors			
Brand	**Blend With**	**Comments**	**Concentration**
1 per GOST 8313-88 Ethylene glycol monoethyl ether (Ethyl Cellosolve. Type A)	GOST 10227-86	Total accumulated percent by volume	0.10 to 0.30%*
TGF per GOST 17477-86 Tetrahydrofurfuryl alcohol	GOST 10227-86	Total accumulated percent by volume	0.10 to 0.30%*
I-M per GOST TU-6-10-1458-79 (50/50 mixture by weight of fuel and methanol)	GOST 10227-36	Total accumulated percent by volume	0.10 to 0.30%*
TGF-M (GOST TU-6-10 1457-79) (50/50 mixture by weight of TGF and methanol	GOST 10227-86	Total accumulated percent by volume	0.10 to 0.30%*
* Standard concentration 0.10% to 0.20% by volume except for extreme cold conditions (below 40°F).			

CAUTION

DO NOT ADD MICROBIOCIDES TO JP-4, JP-5, JP-8, OR NATO CODE F-34. F-40, AND F-44 FUELS. OR ANY FUELS WHERE FUEL SYSTEM ICING INHIBITORS HAVE BEEN ADDED.

1-73-70: FUNGICIDE/BIOCIDE INHIBITORS

Brand	Comments	Concentration
Biobor JF	Intermittent (kill) treatment	Not to exceed 270 ppmw (20 ppm maximum of elemental boron)
KATHON FP 1.5	Intermittent (kill) treatment	100 ppnv
Methyl Cellosolve (EGME) or Prist (DiEGME)	Continuous use	0.15% by volume

1-73-80: ANTI-CORROSION ADDITIVES

Brand	Minimum Dosage*	Maximum Dosage
Innospec DCI-4A	9 mg/L	23 mg/L
Hitec 580	15 mg/L	23 mg/L
Nalco 5403	12 mg/L	23 mg/L
* The minimum dosage is to ensure that sufficient additive is available for lubricity aid.		

1-78-00: ENGINE EXHAUST

1-78-10: THRUST REVERSERS

1. Cancellation of reverse thrust should be initiated so as to be at the reverse idle position by 40 KIAS.
2. Use of thrust reverser(s) for power back is not approved.

1-79-00: ENGINE OIL

1-79-20: OIL INLET TEMPERATURE

1. Before engine start: -40°C minimum.
2. For continuous operation above ground idle: 5°C minimum.
3. Operation above climb thrust: 15°C minimum
4. Steady state operation: 138°C maximum.
5. Transient operation not to exceed 2 minutes: 154°C maximum.

1-79-30: APPROVED OILS

1. Lubricating oil conforming to MIL-PRF-23699 (Type II) or its commercial equivalent. is approved for use with a low temperature limit corresponding to an oil viscosity of not more than 13,000 centistokes (which occurs typically at approximately -40°C/-40°F). Where operation at a lower temperature is required, engine pre-heating may be required for starting.

CAUTION

USE OF MIL-L-7808 IS NOT PERMITTED.

2. Approved engine lubrication system oils - All engine oils listed in this section are fully approved for flight operation.

Approved oils:

BP Turbo Oil 2197 (Exxon Turbo Oil 2197)
BP Turbo Oil 2380 (Exxon Turbo Oil 2380)
Mobil Jet II
Mobil Jet 254

NOTE

1. Mixing of MIL-PRF-23699 approved oil brands is permissible per guidelines in the engine LMM.

In cases where oils approved by Honeywell are not available and other oils must be substituted. Consult with: Honeywell Aerospace, 111 S. 34TH St. Phoenix, AZ 85072.USA, Attention: AS907-2, Customer Support Engineering

1-79-40: OIL PRESSURE

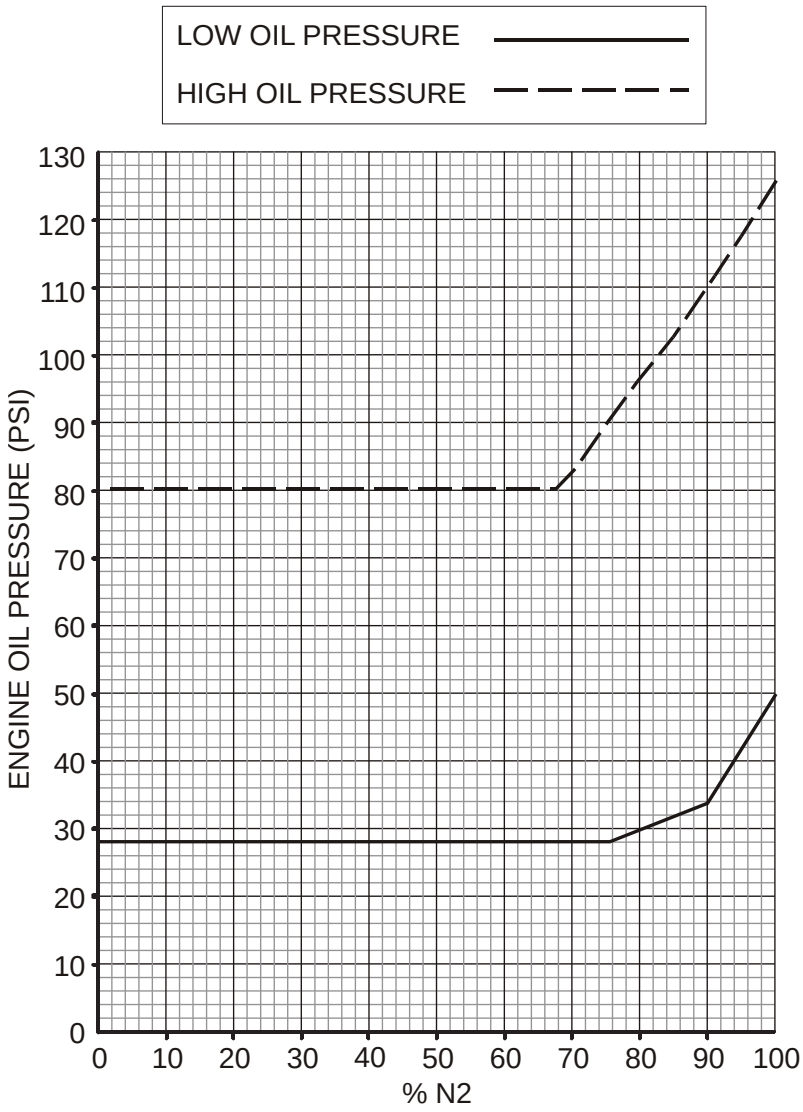

Figure 1-4. Engine Oil Pressure

1-80-00: ENGINE STARTING

1-80-10: STARTER DUTY

DO NOT EXCEED STARTER DUTY CYCLE:

- Three consecutive start cycles, followed by cooling period of 15 minutes prior to additional starts and motoring
- Engine motoring for a maximum of 5 minutes, followed by cooling period of 15 minutes prior to additional starts and motoring.

EICAS WARNING MESSAGES

Following is a ready-reference guide which briefly outlines the message meaning and action to be taken when a message illuminated. It also refers to subject, section and page where more detailed information and procedures are found.

Procedures are grouped by actions. There can be separate procedures for Left (L) system failure, Right (R) system failure and both (L-R) systems failure, or one procedure for both left or right or both system failure as follows:
L/R - (L) or (R)
L-R - (L and R)
L/R/L-R - (L) or (R) or (L and R)

COLLECTOR CAS MESSAGE

If a major failure causes failures of other systems, in order to minimize crew workload and direct the crew to the exact identification of the main failure, it will be marked with (C) as for a collector CAS message. When a collector CAS come on, it may have SA (situational awareness) CAS associated below it in the EICAS window. The collector procedure is designed to take the crew through all action down to landing and include implications of masked and SA CAS message.

SA (SITUATIONAL AWARENESS) CAS MESSAGE

When a collector CAS message comes on, most of the failures that are caused or derived from this failure are masked. Failures that are regarded as important for crew situational awareness will be marked with a caret (**>**) on its left. These SA CAS messages are intended to notify the crew that the collector failure causes a degradation in: flight envelope, pressurization control, environmental control, flight and ground control, and loss of annunciation or alert capabilities.

(Continued)

NOTE

1. On ground, with any warning message on, takeoff is prohibited.
2. MASTER WARNING lights (pilot and copilot) illuminate any time a warning (red) message is initially displayed.
3. When any message comes on, check appropriate switches and circuit breakers.

. Messages having ◀ symbol are accompanied by aural alert.

GENERAL GUIDANCE:

The action part of a step is defined as the system status (i.e. ON, OFF, MAN, AUTO) followed by the physical switch or pushbutton position in parenthesis (i.e. IN, OUT).

Should any abnormal event occur, the following shall apply:

- Maintain control of the airplane
- Other than retracting the landing gear and silencing aural warnings, take no action until above 400 ft AGL.
- If a warning (red) or caution (amber) CAS message occurs between the FAF and the runway, the crew should consider a go around to allow time to read and perform the appropriate procedure prior to landing unless conditions dictate otherwise.
- Resetting tripped circuit breakers or cycling circuit breakers to recover or reboot systems should be done only if the system is required for continued safe flight and landing, and if required by the emergency or abnormal procedure.

Landing urgency consideration:

Land as soon as possible – Land without delay where a safe approach and landing is assured.

Land at nearest suitable airport – Extended flight beyond the nearest approved airport is not recommended.

Land as soon as practicable – The landing site and duration of the flight are at the discretion of the pilot.

WARNING MESSAGES (RED)

(Sheet 1 of 9)

Message	**Cause(s)**	**Corrective Action**
Aircraft CONFIG-Brake ◀	PARK BRAKE lever is not stowed and aircraft on ground, TLA is above max CRZ OR PARK BRAKE lever is not stowed and aircraft on ground and ground speed is above 30 kt	Check PARK BRAKE lever position
Aircraft CONFIG-Flaps ◀	Aircraft on ground and TLA is above Max CRZ or Wheel speed is above 30 kt and: TAWS/FLAP OVRD is pressed or Flaps position is greater than 22°	1. TAWS/FLAP OVRD - OFF 2. Configure flaps position for takeoff 3. Verify takeoff performance and Vspeeds

WARNING MESSAGES (RED)

(Sheet 2 of 9)

Message	Cause(s)	Corrective Action
Aircraft CONFIG-MED ◀	Aircraft on ground, main entry door not closed/locked, one engine is running, Parking Brake OFF and TLA above Max CRZ	1. Thrust Levers - IDLE 2. Main Entry Door (MED) - VERIFY CLOSED *If door is verified closed and locked:* 3. DOOR ACK - PRESS NOTE: Message changes to white as acknowledgement switch is pressed. NOTE: In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message
Aircraft CONFIG-SPLR ◀	Aircraft on Ground, thrust lever above MAX CRZ or Wheel speed is above 30 kt and any of the following: GND SPLR pushbutton is inhibited SPEED BRAKE lever is not stowed Any of spoiler panels are not at retract position	1. GND SPLRS - OFF 2. SPEED BRAKE lever - RETRACT *If message is still displayed:* 3. Spoiler panels position - CHECK VISUALLY

WARNING MESSAGES (RED)

(Sheet 3 of 9)

Message	Cause(s)	Corrective Action
Aircraft CONFIG-Trim ◀	Aircraft on ground, thrust lever above MAX CRZ or Wheel speed is above 30 kt, and any trim is outside green band	Configure trims for takeoff
APU Bleed Leak	Leak or rupture in APU bleed air ducts	1. APU Bleed Air - OFF *If message persists - Shut down APU* 2. APU STOP - PRESS 3. APU MASTER - OFF *If message persists after APU shut down:* 4. Land as soon as possible
APU Fire ◀	APU fire; APU performs automatic shutdown	1. APU FIRE - PRESS 2. Perform APU FIRE, page II-30
Baggage Smoke	Smoke detected in aft baggage compartment.	Perform AIRCRAFT INTERIOR FIRE / SMOKE / FUMES, Page II-31
Bleed Air Leak, L Bleed Air Leak, R Bleed Air Leak, L-R	Bleed air leak detected. (Includes pylon and ATS)	See BLEED AIR LEAK, Page II-23

WARNING MESSAGES (RED)

(Sheet 4 of 9)

Message	Cause(s)	Corrective Action
Cabin Altitude 15000 ◀	Cabin altitude above 15,000 ft. Triggered by altitude limit switch. Cabin pressure controller malfunction	Perform CABIN UNDERPRESSURIZATION, page II-18
Cabin Altitude High ◀	Cabin altitude above 10,000 ft (or 14,750 ft when departure or landing field elevation is above 8000 ft)	Perform CABIN UNDERPRESSURIZATION, Page II-18
DIFF High - Pack to Off	Cabin differential pressure increasing above 9.55 psi	1. PACK - OFF 2. Perform CABIN OVER PRESSURIZATION, page II-25
ENG Oil PRESS Low, L ENG Oil PRESS Low, R ENG Oil PRESS Low, L-R	Indicated engine oil pressure is low with engine running	1. Affected engine - IDLE 2. See ENGINE OIL PRESSURE LOW, Page II-76

WARNING MESSAGES (RED)

(Sheet 5 of 9)

Message	**Cause(s)**	**Corrective Action**
ENG Oil TEMP Low, L ENG Oil TEMP Low, R ENG Oil TEMP Low, L-R	On ground only: Indicated engine not running: OIL TEMP lower than - 40°C; or Indicated engine running: Oil TEMP lower than 5°C (with throttle above idle), or less than 15°C (with throttle below climb thrust)	CAUTION: DO NOT START THE ENGINE(S) WHEN THE OIL TEMPERATURE IS BELOW -40°C) 1. Warm up oil before start/crank attempt CAUTION: IF THE ENGINE(S) IS (ARE) RUNNING AND THE OIL TEMPERATURE IS BELOW 5°C - DO NOT ADVANCE THROTTLE(S) ABOVE IDLE. IF THE ENGINE(S) IS (ARE) RUNNING AND THE OIL TEMPERATURE IS BELOW 15°C - THROTTLES MUST REMAIN BELOW CLIMB THRUST

WARNING MESSAGES (RED)

(Sheet 6 of 9)

Message	Cause(s)	Corrective Action
Engine Exceedance, L Engine Exceedance, R Engine Exceedance, L-R	Indicated engine has exceeded a speed (N_1, N_2) or temperature limit (ITT)	1. Affected engine - REDUCE THRUST CAUTION: DO NOT ATTEMPT FURTHER STARTS. 2. See ENGINE EXCEEDANCE, Page II-56
Engine Fail (C), L Engine Fail (C), R Engine Fail (C), L-R	Indicated engine has flamed out	See ENGINE FAILURE DURING TAKEOFF ABOVE V1, Page II-53 or, SINGLE ENGINE FAILURE IN FLIGHT, Page II-55
Engine Fire, L Engine Fire, R Engine Fire, L-R	Indicated engine fire detected	1. On ground: see ENGINE FIRE ON GROUND, Page II-28 2. In flight: see ENGINE FIRE IN FLIGHT, Page II-29

WARNING MESSAGES (RED)

(Sheet 7 of 9)

Message	Cause(s)	Corrective Action
Feed Fuel LVL Low, L-R	Fuel quantity in the left and right feed tank is 280 lb or less	1. XFLOW valve - OPEN 2. Both STBY PUMP - ON 3. Land as soon as possible CAUTION: AVOID EXTREME NOSE HIGH OR NOSE LOW ATTITUDES, EXCESSIVE FORWARD ACCELERATION AND UNCOORDINATED FLIGHT MANEUVERS
Fuel Pressure Low, L Fuel Pressure Low, R Fuel Pressure Low, L-R	Indicated fuel pressure low while engine running (less than 4.5 psi) - with aircraft above 25,250 ft. Can cause engine to flame out	See FUEL PRESSURE LOW, Page II-49
GND Spoiler Extended	Uncommanded ground spoiler deployment occurs	1. GND SPLRS - INHIB 2. Use manual speed brakes during landing 3. Increase landing distance by 25%
STALL	Stall protection system recognized approach to stall	1. AOA - DECREASE 2. Throttles - MAX THRUST

WARNING MESSAGES (RED)

(Sheet 8 of 9)

Message	Cause(s)	Corrective Action
Thrust REV Unlock, L Thrust REV Unlock, R Thrust REV Unlock, L-R	Indicated thrust reverser unsafe	See THRUST REVERSER UNLOCKED OR DEPLOYED DURING TAKEOFF, Page II-77 or, THRUST REVERSER UNLOCKED OR DEPLOYED IN FLIGHT, Page II-79 or, LANDING WITH THRUST REVERSER DEPLOYED, Page II-81

WARNING MESSAGES (RED)

(Sheet 9 of 9)

Message	**Cause(s)**	**Corrective Action**
WAI Bleed Leak, L WAI Bleed Leak, R WAI Bleed Leak, L-R	Indicated wing anti ice (WAI) duct or common duct bleed air leak detected	1. Both WING ANTI ICE - OFF 2. Bleed air / anti-ice synoptic page - DISPLAY 3. Depart icing conditions CAUTION: 1. FOR ANY WING ANTI ICE FAILURE, IF ICING CONDITIONS WERE MET WHILE WINGS ARE COLD, USE V_{REF}. + 20 KT FOR APPROACH AND LANDING AND INCREASE LANDING DISTANCE BY 40%. 2. DO NOT EXCEED TIRE SPEED LIMITATIONS (182 KT GROUNDSPEED). *If failure persists:* 4. Land as soon as possible

<<END>>

PFD (ADI AND HSI) WARNING SYMBOLS AND FLAGS (RED)

ADI Warning Flags

(Sheet 1 of 3)

Symbol/Flag	Meaning	Initial Action/Reference
Chevron (in pitch field)	Excessive pitch	Initiate pitch correction in indicated direction.
RA X.XXNM/ ±XX↑/↓	No bearing resolution advisory with traffic's (relative or absolute) altitude (in 100's ft) and altitude trend.	Initiate altitude correction as indicated by resolution advisory pitch steering guidance on PFD.
TRAFFIC	Resolution advisory alert	Check for resolution advisory steering and traffic information on PFD and MAP
Red square with associated 2 or 3 digit number and up/down arrow	Resolution advisory symbol at bearing/distance of traffic, with traffic's (relative or absolute) altitude (in 100's ft) and altitude trend.	Initiate altitude correction as indicated by resolution advisory pitch steering guidance on PFD.
Pair of opposing vertically oriented trapezoids in pitch field	Resolution advisory pitch steering guidance	Set pitch as steering guidance indicated (into the green box) and climb/descent to avoid traffic.
X in blank CAS field	No CAS Indications	CAS message annunciations are not available.

PFD (ADI AND HSI) WARNING SYMBOLS AND FLAGS (RED)

ADI Warning Flags

(Sheet 2 of 3)

AP1 (flashing) AP2 ←	Autopilot disengage flag	Take manual control of aircraft. Re-engage Autopilot if available according to pilot's discretion.
IAS	Indicated side airspeed failure flag.	Revert to cross side airdata (SMC-SENSR-ADS) or use ISI.
ALT	Indicated side altitude failure flag.	Revert to cross side airdata (SMC-SENSR-ADS) or use ISI.
ATT	Indicated side attitude failure flag.	Revert to cross side attitude (SMC-SENSR-AHS) or use ISI.
FD	Indicated flight director guidance failure flag.	Revert to cross-side AFCS (SMC-SENSR-AFCS).
FPV	Flight path data failure flag.	Verify selected FD command bar style is VBAR or XPTR. (SMC-ADI)
FMS	FMS lateral deviation data failure flag.	Use valid (cross-side or 3rd if installed) FMS as navigation source (SMC-NAV)
GS	Glideslope failure flag.	Revert to other NAV Source (SMC-NAV)

PFD (ADI AND HSI) WARNING SYMBOLS AND FLAGS (RED)

ADI Warning Flags

(Sheet 3 of 3)

LOC	Localizer deviation failure flag.	Revert to other NAV Source (SMC-NAV). Check NAV radio frequency.
MACH	Indicated side Mach failure flag.	Revert to cross side airdata (SMC-SENSR-ADS) or use ISI.
PULL UP	TAWS detect excessive descent rate or rapidly rising terrain (TAWS mode 1 and 2A).	Execute TAWS ESCAPE PROCEDURE, Page X-1-10.
RA	Radio altimeter failure flag.	Altimeter is unavailable. Revert to adequate minima. Expect A/T Retard Inhibit caution CAS message.
SVS	SVS failure flag.	Deselect SVS (SMC-ADI).
V N V	VNAV deviation failure flag. Vertical deviation is exceeding operating limitations or VNAV data is missing from FMS.	Perform manual vertical commands on FCP. Check FMS Flight plan.
VS	Indicated side vertical speed failure flag.	Revert to cross side airdata (SMC-SENSR-ADS) or use ISI.
WINDSHEAR	TAWS detects a severe wind shear condition (performance reduces)	Execute WINDSHEAR ESCAPE PROCEDURE, Page X-1-12.

PFD (ADI AND HSI) WARNING SYMBOLS AND FLAGS (RED)

HSI Warning Flags

Symbol/Flag	Meaning	Initial Action/Reference
FMS1 FMS2	Indicated FMS lateral deviation data failure flag.	Use valid (cross-side or 3rd if installed) FMS as navigation source (SMC-NAV)
HDG	Heading data failure flag.	Revert to cross side heading (SMC-SENSR-AHS) or use ISI.

ATA 21 - AIR CONDITION AND PRESSURIZATION

RAPID DECOMPRESSION

1. Crew oxygen masks.....DON,100%
2. Crew communications..... ESTABLISH
3. PASSENGER OXYGEN selector.....BYPASS
4. Passengers ..... ENSURE RECEIVING OXYGEN (GREEN LIGHT)
5. SEAT BELT and NO SMOKE pushbuttons .....ON

NOTE

CABIN ALTITUDE HIGH CAS message is expected to come on if cabin altitude climbs above 10,000 ft.

CAUTION

ADM WILL DESCEND TO 15,000 FT MSL. DISCONNECT ADM IF A HIGHER ALTITUDE IS REQUIRED TO AVOID TERRAIN.

NOTE

It is recommended that the emergency descent be flown manually in order to achieve maximum descent rate.

As long as ADM is active, pilot commands to change selected heading/track, vertical mode, autothrottle mode and ALT SEL are ignored, including use of the PUSH SYNC pushbutton.

(Continued)

If autopilot was not engaged prior to decompression or ADM is overridden by autopilot disconnect:

6. Thrust levers ..... IDLE
7. Speed brakes ..... DEPLOY FULLY
8. Airspeed ..... MAINTAIN M_{MO} / V_{MO}

If structural integrity is in doubt, limit speed as much as possible and avoid high maneuvering loads.

9. Airways ..... LEAVE AT 90° OFF ROUTE
10. ATC ..... DECLARE EMERGENCY
11. Transponder 7700
12. EXT LTS ..... ON ALL
13. Descend to 15,000 ft or MEA whichever is higher

<<END>>

CABIN UNDERPRESSURIZATION

Cabin Altitude 15000 or Cabin Altitude High warning message on indicates insufficient cabin pressure.

NOTE

The messages are triggered by different logic circuits in the controller and are mutually exclusive.

1. Crew oxygen masks.....DON, 100%
2. Crew communication..... ESTABLISH
3. PASSENGER OXYGEN switch.....BYPASS
4. Passengers ..... ENSURE RECEIVING OXYGEN (GREEN LIGHT)
5. CPCS MODE .....MAN
6. CABIN ALT selector..... DESCEND

CAUTION

ADM WILL DESCEND TO 15,000 FT MSL. DISCONNECT ADM IF A HIGHER ALTITUDE IS REQUIRED TO AVOID TERRAIN.

NOTE

As long as ADM is active, any autopilot mode change will be ignored, including use of the PUSH SYNC pushbutton.

(Continued)

If message remain on:

7. Descend to 15,000 ft or MEA which ever is higher

CAUTION

1. IF HIGHER ALTITUDE THAN 15,000 FT IS REQUIRED FOR SAFE FLIGHT - SEE FIGURES 2-1 AND 2-2 FOR OXYGEN PRESSURE AND DURATION).
2. PRESSURIZATION LEAK MAY OCCUR FROM BAGGAGE COMPARTMENT. ONLY IF HIGH ALTITUDE IS ESSENTIAL FOR SAFETY OF FLIGHT - CHECK THAT NO PASSENGERS ARE IN THE BAGGAGE COMPARTMENT AND CLOSE THE DOOR. AFTER INTERNAL BAGGAGE DOOR IS CLOSED - MOVE BAGGAGE SMOKE HANDLE TO SMOKE EVAC POSITION.

<<END>>

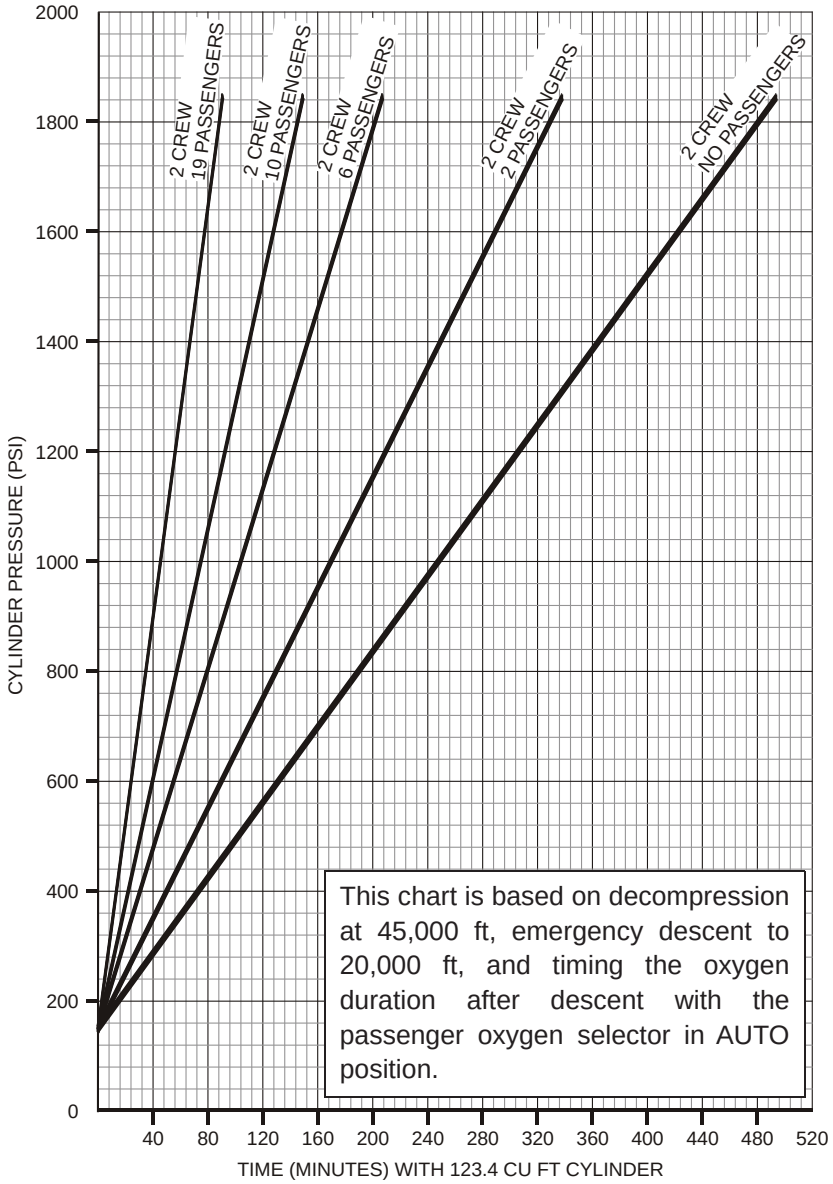

Figure 2-1. Oxygen Duration; 123.4 CU FT

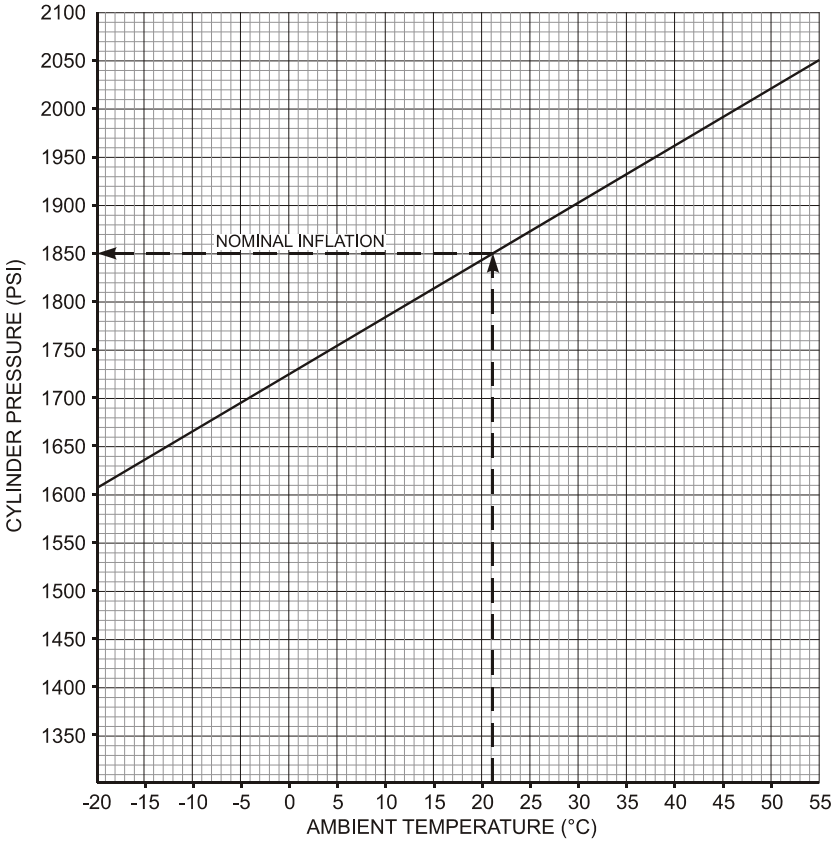

Figure 2-2. Oxygen Pressure Versus Temperature

EMERGENCY DESCENT

NOTE

It is recommended that the emergency descent be flown manually in order to achieve maximum descent rate.

1. Thrust levers ..... IDLE
2. Speed brakes ..... DEPLOY FULLY
3. Airspeed ..... MAINTAIN M_{MO} / V_{MO}

If structural integrity is in doubt, limit speed as much as possible and avoid high maneuvering loads.

4. Airways..... LEAVE AT 90 ° OFF ROUTE
5. ATC ..... DECLARE EMERGENCY
6. Transponder 7700
7. EXT LTS ..... . ALL ON
8. Descend to 15,000 ft or MEA whichever is higher

<<END>>

BLEED AIR LEAK

Bleed Air Leak, L-R warning messages come on when a dual bleed air leak is detected or a common bleed air tube is ruptured.

DUAL FAILURE

1. Diversion is required
2. Thrust ..... REDUCE TO MINIMUM FOR SAFE FLIGHT
3. If in icing conditions:
   a. Wing anti ice ..... OFF
   b. Exit icing conditions.

CAUTION

1. FOR ANY WING ANTI ICE FAILURE, IF ICING CONDITIONS WERE MET WHILE WINGS ARE COLD, USE V_{REF}. + 20 KT FOR APPROACH AND LANDING AND INCREASE LANDING DISTANCE BY 40%.
2. DO NOT EXCEED TIRE SPEED LIMITATIONS (182 KT GROUNDSPEED).

4. Bleed/anti ice synoptic page ..... MONITOR

If message persists:

5. Oxygen masks ..... DON, 100%
6. Passenger oxygen ..... DEPLOY MANUALLY
7. Both ENG BLEED ..... OFF
8. BLEED AIR ISOLATION ..... VERIFY CLOSED
9. PACK ..... OFF
10. Perform EMERGENCY DESCENT, Page II-22

NOTE

In this state no bleed source is available. Cabin altitude will climb due to normal fuselage air leakage until ambient altitude is reached.

11. Land at nearest suitable airport

SINGLE FAILURE

Bleed Air Leak, L or Bleed Air Leak, R warning message comes on when a single bleed air leak is detected or one side bleed air tube is ruptured.

1. Diversion is required
2. Affected engine thrust .....REDUCE
3. Bleed/anti ice synoptic page .....OBSERVE

If message persists:

4. Affected ENG BLEED AIR.....OFF
5. BLEED AIR ISOLATION..... VERIFY CLOSED

If message persists, shutdown the affected engine:

6. Both WAI switches .....OFF

NOTE

If WAI activation is required proceed to - WING ANTI ICE OPERATION ON SINGLE SOURCE, Page IIIA-188

7. Perform ENGINE SHUTDOWN IN FLIGHT, page II-57

<<END>>

CABIN OVER PRESSURIZATION

DIFF High - Pack to Off warning message on indicates that cabin over pressurization DIFF light is illuminated on the overhead panel.

1. PACK ..... OFF
2. CPCS MODE ..... MAN
3. CABIN ALT selector ..... CLIMB

If outflow valve is responding:

4. PACK ..... ON
5. CABIN ALT selector ..... AS REQUIRED

If differential cabin pressure (ΔP) cannot be reduced:

6. Descend until ΔP display turns green

CAUTION

DO NOT DESCEND BELOW MEA (MINIMUM ENROUTE ALTITUDE)

7. Both ENG BLEED AIR ..... OFF
8. Thrust lever ..... IDLE

If differential cabin pressure (ΔP) remains at or above 9.55:

9. DUMP ..... ON
10. LAND AS SOON AS PRACTICABLE

<<END>>

ATA 22 - AUTO FLIGHT

AUTOMATIC DESCENT MODE (ADM)

If a high cabin altitude is detected, the aircraft activates an automatic descent mode function. This protects the aircraft occupants by descending as quickly as possible to an altitude where there is a greater concentration of oxygen.

Triggered when:

- Aircraft altitude is above 34,000 ft
- Autopilot engaged
- Cabin altitude above 10,000 ft

NOTE

Autopilot disengagement can be used at all time to exit ADM mode. Flight crew may override any of the AFCS functions using normal input to controls. As long as ADM is active, any autopilot mode change will be ignored, including use of the PUSH SYNC pushbutton.

Mode functions:

1. ADM red annunciation is provided on FMA.
2. 5 seconds after ADM triggered the transponder code resets to 7700.
3. Lateral mode changes to HDG and selected HDG changes to 90° left of original course.
4. Autothrottle will engage If not engaged before. Thrust levers will move to idle
5. Altitude selector resets to 15,000 ft
6. Airspeed target changes to M_{MO} then V_{MO} in concert with the airspeed automatic transition
7. Aircraft starts descent

(Continued)

8. On reaching 15,000 ft, AFCS captures the altitude and airspeed command changes to 225 kt. Autothrottle remains engaged
9. Autopilot establishes left orbit at 15,000 ft and 225 kt
10. ADM Complete advisory message comes on

NOTE

When ADM is active HSI will switch to 120° arc map format, range 10 NM and WXR overlay will de-selected automatically.

<<END>>

ATA 26 - FIRE PROTECTION

ENGINE FIRE ON GROUND

Engine Fire, L, Engine Fire, R or Engine Fire, L-R warning message is on when a fire is detected in the affected engine(s). Affected side N_1 dial has FIRE annunciator and FUEL CONTROL switch is illuminated.

1. Aircraft ..... STOP
2. PARK BRAKE ..... SET
3. Both engines thrust levers ..... IDLE
4. Both engines FUEL CONTROL switches ..... OFF
5. Affected engine ..... IDENTIFY/CONFIRM
6. Affected engine FIRE handle ..... PULL, ROTATE TO DISCH 1 (OUTBOARD POSITION)

NOTE

Allow minimum 30 seconds between each discharge.

7. APU MASTER ..... OFF
8. Emergency Evacuation:
   a. ATC ..... ADVISE
   b. Main entry door / emergency exit ..... OPEN AS REQUIRED
   c. Passengers evacuation ..... INITIATE

9. If fire warning indications persist for more than 30 seconds, Affected engine FIRE handle ..... ROTATE TO DISCH 2 (INBOARD POSITION)
10. Both batteries ..... OFF
11. STBY BATT ..... OFF

<<END>>

ENGINE FIRE IN FLIGHT

Engine Fire, L, Engine Fire, R or Engine Fire, L-R warning message is on when a fire is detected in the affected engine(s). Affected side N1 dial has FIRE annunciator and FUEL CONTROL switch is illuminated.

1. Affected engine ..... IDENTIFY/CONFIRM
2. Affected engine thrust lever ..... IDLE
3. Affected engine FUEL CONTROL switch..... OFF
4. Affected engine FIRE handle ..... PULL
5. Time Hack..... 10 SECONDS

If fire is extinguished and no fire system failures are annunciated, continue to step 8

6. Engine FIRE handle..... ROTATE TO DISCH 1 (OUTBOARD POSITION)

NOTE

Allow minimum 30 seconds between each discharge.

*If warning indications persist for more than 30 seconds or fire system indicates a failure (*FIRE LOOP *or* SQUIB FAIL*):*

7. Affected engine FIRE handle ..... ROTATE TO DISCH 2 (INBOARD POSITION)
8. Affected fuel STBY PUMP ..... NOT ARM AND OFF
9. Affected ENG BLEED AIR ..... OFF
10. Fuel balance ..... MONITOR
11. TCAS .....VERIFY TA ONLY
12. Land at nearest suitable airport
13. PERFORM SINGLE-ENGINE APPROACH AND LANDING, page II-66

<<END>>

APU FIRE

Overhead APU FIRE light in pushbutton and APU Fire warning message illuminates when the fire detection system has detected a fire or overheat in the APU compartment.

NOTE

An automatic APU shutdown is expected.

1. APU FIRE pushbutton.....PRESS

NOTE

The green ARM/EMPTY light in pushbutton illuminates.

2. APU BLEED AIR .....OFF

If fire persists:

3. ARM / EMPTY.....PRESS

CAUTION

ONLY ONE FIRE BOTTLE (#1) IS AVAILABLE FOR FIGHTING AN ENGINE FIRE FOLLOWING AN APU FIRE.

When RPM is below 5%:

4. APU MASTER.....OFF
5. Land at nearest suitable airport

CAUTION

DO NOT RESTART APU AFTER SHUTDOWN DUE TO A FIRE.

After landing:

6. Aircraft..... STOP
7. PARKING BRAKE.....SET
8. Evacuate passengers as soon as practical. See EMERGENCY EVACUATION, page II-87

<<END>>

AIRCRAFT INTERIOR FIRE / SMOKE / FUMES

1. Crew oxygen masks and smoke goggles ..... DON, 100%

WARNING

1. CONSIDER ALL SMOKE AND / OR FUMES TO BE TOXIC.
2. DO NOT DELAY DESCENT OR DIVERSION TO FIND THE SMOKE SOURCE. REGARDLESS OF WHETHER A FIRE HAS BEEN EXTINGUISHED OR SMOKE HAS CLEARED, CONSIDERATION SHOULD BE GIVEN TO LANDING THE AIRCRAFT WITHOUT DELAY.

WARNING

EXERCISE EXTREME CAUTION WHEN USING OXYGEN NEAR OPEN FLAME.

2. Crew communication ..... ESTABLISH
3. NO SMOKE / SEAT BELT ..... ON

(Continued)

4. Passenger Oxygen Mask.....BYPASS; VERIFY MASKS DEPLOYED

NOTE

Visually confirm that an oxygen mask has deployed for each passenger. Advise passengers to DON oxygen masks.

CAUTION

ONCE DUMP SELECTED AND CABIN ALTITUDE CLIMBS ABOVE 10,000 FT, AND AIRCRAFT IS AT OR ABOVE 34,000 FT, ADM MODE WILL BE TRIGGERED. TO OVERRIDE ADM MODE - DISCONNECT AUTOPILOT AND SELECT OTHER MODE(S) AS DESIRED.

5. DUMP.....ON

NOTE

1. Stop the cabin altitude rise before 10,000 ft if smoke, clears by deselecting DUMP.
2. The following messages display: CPCS Dump Selected caution message Cabin Altitude High warning message will be displayed once cabin altitude exceeds 10,000ft.

6. ATC .....DECLARE EMERGENCY
7. Transponder.....VERIFY 7700
8. All UTILITY pushbuttons .....OFF

(Continued)

If flight level is not critical:

9. Emergency descent .....INITIATE

NOTE

Use of autopilot and autothrottles is recommended. Set altitude preselector to desired safe altitude.

a. Thrust Levers..... .IDLE
b. Airspeed.....ACCELERATE TO M_{MO} / V_{MO}
c. Speed brakes.....DEPLOY FULLY
d. Airways .....TURN 90 DEGREES OFF ROUTE
e. EXT LTS..... ALL ON
f. Descend to 25,000 Ft or lower or MEA which ever is higher.

Proceed to the appropriate section to complete checklist:

- SECTION A: FIRE / SMOKE / FUMES IN COCKPIT, CABIN, OR BAGGAGE COMPARTMENT, Page II-34
- SECTION B: SMOKE FROM AIR CONDITIONING OUTLETS (POSSIBLE BLEED AIR SOURCE), Page II-36
- SECTION C: ELECTRICAL FIRE / SMOKE SOURCE UNKNOWN, Page II-38

(Continued)

SECTION A: FIRE / SMOKE / FUMES IN COCKPIT, CABIN, OR BAGGAGE COMPARTMENT

1. PBE (Portable Breathing Equipment), headset, hand mic, and portable extinguisher (investigating crew member). DON / CARRY
2. Fire / smoke / fumes..... LOCATE / EXTINGUISH / ELIMINATE

If source of fire / smoke / fumes is in the baggage compartment and is suspected to be electrical (unidentified smoke source or smoke from behind baggage compartment liners), go to step 14, page II-41

If the fire or smoke is in baggage compartment and appears to be limited and may be extinguishable (door open or through door eyelet if door closed):

3. Crew communication..... RE-ESTABLISH (Plug a hand mic and headset into the aft radio rack. Select CAB on the ACP and use PTT.)
4. Fire / smoke / fumes..... LOCATE / EXTINGUISH / ELIMINATE

If the fire or smoke are moderate / intense:

5. Interior baggage door.....CLOSE
6. SMOKE EVAC selector ..... SMOKE EVAC

NOTE

The following caution messages come on: BAG Dump Valve Open, BAG ISO Valve Closed and BAG CMPT PRESS Low.

7. Time hack.....2 MINUTES MINIMUM

After at least 2 minutes, if fire is reduced or eliminated (verify through door eyelet)

8. SMOKE EVAC selector ..... BAG PRESS

(Continued)

When BAG CMPT PRESS Low *caution message is no longer*

displayed, open the baggage interior door:

9. Fire / smoke / fumes ..... LOCATE / EXTINGUISH / ELIMINATE
10. SMOKE EVAC selector ..... AUTO

NOTE

This action re-arms baggage compartment pressure leak detection.

11. Land at nearest suitable airport

NOTE

If smoke/fire is eliminated and crew decides to deselect DUMP to regain auto cabin pressurization schedule, verify first that baggage pressurization is activated using SMOKE EVAC knob in BAG PRESS position.

SECTION B: SMOKE FROM AIR CONDITIONING OUTLETS (POSSIBLE BLEED AIR SOURCE)

NOTE

Allow sufficient time between bleed air source selection to determine source of smoke / fumes. If the smoke / fumes clear, maintain bleed air source in its last position.

1. L ENG BLEED.....OFF

NOTE

BAS Off, L caution message comes on.

If smoke / fumes still persist:

2. L ENG BLEED.....ON
3. R ENG BLEED.....OFF

NOTE

BAS Off, R caution message comes on.

If smoke / fumes still persist:

4. R ENG BLEED.....ON
5. ALTN PRESS.....ON

NOTE

PACK indicates OFF and the following caution messages come on: Pack Off, and ALTN PRESS Selected.

If smoke / fumes still persist:

6. ALTN PRESS.....OFF

If smoke / fumes clear - land at nearest suitable airport.

(Continued)

If smoke / fumes still persist, its source does NOT originate from the bleed air system:

7. Fire / smoke / fumes ..... LOCATE / EXTINGUISH / ELIMINATE

If required, continue with SECTION A: FIRE / SMOKE / FUMES IN COCKPIT, CABIN, OR BAGGAGE COMPARTMENT, Page II-34*, or* SECTION C: ELECTRICAL FIRE / SMOKE SOURCE UNKNOWN, Page II-38

8. LAND AS SOON AS POSSIBLE

(Continued)

SECTION C: ELECTRICAL FIRE / SMOKE SOURCE UNKNOWN

WARNING

WARNING: DO NOT DELAY LANDING AT THE NEAREST SUITABLE AIRPORT IN AN ATTEMPT TO COMPLETE THE CHECKLIST.

1. Dome light ..... BRT
2. Fire / smoke / fumes..... LOCATE AND REMOVE POWER FROM SYSTEM

If smoke / fumes clear - land at nearest suitable airport.

NOTE

For the following steps, allow a minimum of 30 seconds between each step to allow time for a difference in the level of smoke or fumes to be obtained before proceeding to the next step.

If smoke / fumes originate from the overhead panel, proceed to step 3*.*

If smoke / fumes originate from the forward wall of the baggage compartment, proceed to step 14*.*

3. R DISTR CB (B12) ..... PULL

NOTE

Q-Feel and AUTO pressurization will not be available and DISTR Bus Fail (C), R caution message comes on.

If smoke / fumes clear, land at nearest suitable airport. continue with R DISTRIBUTION BUS FAIL, Page IIIA-122

4. R DISTR CB (B12) ..... RESET
5. Autopilot ..... DISCONNECT

(Continued)

6. L DISTR CB (B2)..... PULL

NOTE

Pedal feedback, AP and SP are not available and DISTR Bus Fail (C), L caution message comes on.

If smoke / fumes clear, land at nearest suitable airport. continue with L DISTRIBUTION BUS FAIL, Page IIIA-120

7. L DISTR CB (B2)..... RESET
8. STBY BATT..... OFF

NOTE

AP 1-2 Fail, A/T 1-2 Fail, Stick Pusher Fail, Mach Trim Fail caution messages come on.

If smoke / fumes clear, land at nearest suitable airport. continue with STBY BUS FAILURE, Page IIIA-135

(Continued)

9. STBY BATT.....ON

CAUTION

1. THE NEXT STEPS ARE DESIGNED TO ISOLATE THE EMERGENCY BUSES AS A SOURCE OF SMOKE / FUMES. EMERGENCY BUS POWER OFF CAUSES A CHANGE IN HANDLING QUALITIES AND REQUIRES CLOSE ATTENTION BY THE PILOTS.
2. AFTER THE NEXT STEP, THE FOLLOWING SYSTEMS WILL BE INOPERATIVE:
   - Flaps, normal and alternate
   - Inboard spoilers
   - Inboard brakes
   - Q-Feel
   - ALTN STAB
   - NWS
   - APU Start

10. REB PWR - FEED CB (A18).....PULL

NOTE

For the next step, EMER Bus Fail (C), R caution message comes on.

If smoke / fumes clear, land at nearest suitable airport. continue with R EMERGENCY BUS FAIL, Page IIIA-106.

(Continued)

11. REB PWR - FEED CB (A18)..... RESET

CAUTION

AFTER THE NEXT STEP, THE FOLLOWING SYSTEMS WILL BE INOPERATIVE:

- DU 1
- STAB Trim
- Ground Spoilers
- Outboard Spoilers
- Outboard Brakes
- Left Stick Shaker
- Pack

12. LEB PWR - FEED CB (A8) ..... PULL

NOTE

EMER Bus Fail (C), L caution message comes on.

If smoke / fumes clear, land at nearest suitable airport. continue with L EMERGENCY BUS FAIL, Page IIIA-102*.*

13. LEB PWR - FEED CB (A8) ..... RESET

If smoke / fumes do NOT clear, LAND AS SOON AS POSSIBLE while investigating other sources of fire / smoke / fumes.

If smoke / fumes originate from the baggage compartment and are suspected to be electrical proceed with step 14.

14. Interior baggage door..... CLOSE
15. SMOKE EVAC selector..... SMOKE EVAC

NOTE

The following caution messages come on: BAG Dump Valve Open, BAG ISO Valve Closed and BAG CMPT PRESS Low.

(Continued)

16. L and R MAIN TIE CBs (A2, A12) .....PULL

NOTE

Q-Feel and auto pressurization will not be available and Main Bus Fail (C), R caution message comes on.

17. R GEN.....OFF
18. R BATT.....OFF

If smoke / fumes clear, land at nearest suitable airport. continue with R MAIN BUS FAIL, Page IIIA-116*.*

19. R BATT.....ON
20. R GEN.....ON

NOTE

Pedal feedback, AP and SP will not be available and Main Bus Fail (C), L caution message comes on.

21. GEN .....OFF
22. L BATT .....OFF

If smoke / fumes clear, land at nearest suitable airport. continue with L MAIN BUS FAIL, Page IIIA-114*.*

23. L BATT .....ON
24. L GEN .....ON
25. L and R MAIN TIE CBs (A2, A12) .....RESET
26. LAND AS SOON AS POSSIBLE

NOTE

If smoke/fire is eliminated and crew decides to deselect DUMP to regain auto cabin pressurization schedule - verify first that baggage pressurization is activated by selecting the SMOKE EVAC switch to BAG PRESS position.

<<END>>

RIGHT AFT RADIO RACK HOT

AFT Radio Rack Hot, R caution message comes on when right aft radio rack overheats. The radio rack is located in the right aft side of the lavatory and covered by removable wall covers.

1. CABIN TEMP CONTROL..... MAN / FULL COLD
2. EER cover panels ..... REMOVE AND CHECK FOR HOT COMPONENTS
3. Hot component(s) .....PULL COMPONENT POWER CIRCUIT BREAKER(S)
4. Land as soon as practicable

NOTE

The right aft radio rack contains the following units:

- ECS Cockpit duct.
- Fuel Quantity Measurement Computer (FQMC)
- Remote Oil Calibration System (ROLS)
- FCECU 2
- DCU 2
- Aft LTS EMER BATT
- SATCOM - Iridium (Option)
- APU ECU

<<END>>

ATA 27 - FLIGHT CONTROLS

Stall Recovery

Stall indications (either one):

- STALL warning CAS displayed and triple chime.
- Stick shaker operating.
- Stick pusher triggered.

1. Thrust Levers .....MAX THRUST
2. Pitch Attitude .....DECREASE AS PRACTICABLE (CONSIDER GROUND PROX)
3. Speedbrakes ..... VERIFY RETRACTED
4. Roll attitude .....WINGS LEVEL

If flaps are LND:

5. Flaps 20

After airspeed increasing and stall warning extinguished:

6. Pitch attitude ..... AS DESIRED
7. Thrust Levers ..... AS DESIRED

<<END>>

ATA 28 - FUEL

FUEL LEAK

Fuel leak indications:

- An increasing difference in fuel quantity between wing tanks indicated by Fuel Imbalance caution message
- An increasing difference between FMS predicted fuel quantity (higher) and FQMC measured fuel quantity (lower)
- A steady Fuel Pressure Low, L or Fuel Pressure Low, R warning message with an operating standby pump (STBY Pump On, L or STBY Pump On, R caution message)
- STBY Pump On, L or STBY Pump On, R caution message may indicate fuel leak in the motive flow line between the engine and the feed tank jet pump. (check for difference between FMS predicted fuel and FQMC measured fuel)
- Abnormally high fuel flow or fuel flow out of range indication on one of the engines
- Visible from flight deck or cabin windows or external report
- Fuel odor in the cabin
- Fuel Transfer Fault caution message comes on, combined with one of the above messages

In order to determine an actual fuel leak, compare the following:

- Total fuel quantity change Vs. flight planed fuel
- One engine fuel flow higher then the other

1. Diversion may be required
2. FUEL JETT ..... VERIFY OFF
3. FUEL X FLOW ..... CLOSE
4. FUEL INTERCONNECT ..... CLOSE

If fuel leak is not visible go to step 13

A. FUEL LEAKAGE IS VISIBLE OR SUSPECTED FROM WING / FUSELAGE

If fuel is leaking from one of the fuselage tanks (forward, center or aft):

5. Continue flight. Evaluate fuel loss and monitor fuel reserves for destination

If fuel leak is identified to be from a wing tank:

6. Affected side STBY FUEL pump .....ON

NOTE

STBY Pump On, L or STBY Pump On, R caution message will come on.

7. FUEL XFLOW .....OPEN

NOTE

Fuel XFLOW Valve Open status message will come on.

CAUTION

LANDING HANDLING QUALITIES MUST BE CHECKED PRIOR TO LANDING IF FUEL IMBALANCE IS ABOVE DEMONSTRATED VALUE (ABOVE 900 LB BETWEEN WING TANKS).

CONSIDERATION SHOULD BE GIVEN TO THE FOLLOWING:

- Climb to altitude in order to achieve greater range
- Maximum transfer of fuel to non leaking tank versus lateral controllability
- Affected side engine may flameout due to fuel starvation
- Two engines versus Single engines cruise performance.

(Continued)

NOTE

Transfer fuel from a leaking wing if needed, to reach destination with one engine operating and without exceeding the unbalance limitations for flight / landing.

When fuel balance not required any more:

8. FUEL XFLOW ..... CLOSE
9. Leaking tank FUEL STBY PUMP ..... OFF

Prior to final approach:

10. Aircraft landing configuration ..... ESTABLISH
11. Aircraft controllability and handling characteristics ..... CHECK

CAUTION

IF ENGINE FLAMED OUT OR FAILED, PERFORM ENGINE SHUTDOWN IN FLIGHT, Page II-57.

12. Perform BEFORE LANDING, Page IV-37

B. FUEL LEAKAGE IS NOT VISIBLE AND ONE OF THE FOLLOWING IS SUSPECTED:

- Engine Internal fuel leak (abnormally high fuel flow, feed tank leak)

13. Single engine performance / range ..... COMPUTE

WARNING

1. THIS PROCEDURE WILL RESULT IN ENGINE SHUT DOWN. TERRAIN CLEARANCE AND AIRCRAFT SINGLE ENGINE PERFORMANCE MUST BE TAKEN INTO CONSIDERATION.
2. TRANSFER OF FUEL FROM LEAKING FEED TANK SHOULD BE PERFORMED ONLY AS A LAST RESORT AND MAY CAUSE THE FUEL LEAK TO RESUME.

NOTE

The APU is fed by fuel pressure from the right engine manifold only. If the fuel leak is suspected to be from the Right fuel system, APU performance may be erratic, and/or not meet maximum altitude APU starting performance. Consider APU shutdown.

If engine flamed out:

14. Continue with ENGINE SHUTDOWN IN FLIGHT, page II-57

<<END>>

FUEL PRESSURE LOW

Fuel Pressure Low, L, Fuel Pressure Low, R or Fuel Pressure Low, L-R warning message indicates that fuel pressure is low when aircraft is ABOVE 25,250 ft.

Fuel Pressure Low, L, Fuel Pressure Low, R or Fuel Pressure Low, L-R caution message indicates that the fuel pressure is low when aircraft is BELOW 25,250 ft, or on the ground with engine running.

WARNING

LOW FUEL PRESSURE MAY CAUSE AN ENGINE FLAMEOUT ABOVE FL 250.

CAUTION

1. AVOID ABRUPT THRUST LEVER MOVEMENTS.
2. LOW FUEL PRESSURE MAY INDICATE A FUEL LEAK IN THE MOTIVE FLOW LINE. FUEL QUANTITY AND BALANCE SHOULD BE MONITORED CAREFULLY.

NOTE

In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message.

If a fuel leak is suspected, see FUEL LEAK, page II-45

1. Affected side STBY FUEL PUMP pushbutton.....VERIFY ON

If message persists:

2. Affected side thrust lever- IDLE
3. Descend to FL 250 or below
4. LAND AS SOON AS PRACTICABLE

<<END>>

ATA 32 - LANDING

BLOWN TIRE DURING TAKEOFF

Indications:

1. If a main gear tire blows, the aircraft will veer toward the blown tire
2. Loud or muffled noise caused by initial tire destruction
3. Continuous rumble or vibration caused by flat tire

NOTE

A blown nose wheel tire may cause engine FOD. Nose blown tire may damage the nose gear doors or nosewheel well equipment. A blown main gear tire may damage the flaps, and/or brake lines.

If decision is made to stop:

1. Takeoff.....ABORT

CAUTION

DO NOT TAXI WITH FLAT TIRE.

If takeoff is continued:

2. Landing gear ..... DO NOT RETRACT
3. Flaps .....DO NOT CHANGE CONFIGURATION
4. Aircraft weight .....REDUCE;
   (Consider FUEL JETTISON, Page IIIA-164 or Burn off fuel)

(Continued)

For landing:

5. Runway ..... LONGEST AND WIDEST AVAILABLE
6. Use all means available to maintain directional control
7. Plan to land on opposite side of the runway from the blown main tire (aircraft would veer toward the blown tire)
8. Thrust reversers ..... USE MAX REVERSE THRUST

NOTE

Expect that blown tire brake might not build braking pressure. Adjacent brake on same strut shall compensate for anti skid use.

<<END>>

ATA 72-80 - ENGINE

TAKEOFF ABORT

1. Thrust levers ..... IDLE
2. Wheel brakes ..... MAXIMUM BRAKING
3. Thrust reversers ..... AS REQUIRED
4. Ground spoilers ..... VERIFY EXTENDED

When stopped:

5. Tower ..... NOTIFY
6. Passengers ..... ADVISE / EVACUATE AS NECESSARY; see EMERGENCY EVACUATION, Page II-87

<<END>>

ENGINE FAILURE DURING TAKEOFF ABOVE V1

Continue takeoff:

1. Thrust levers ..... MAXIMUM THRUST
2. APR.....VERIFY ON; press APR pushbutton if required

After lift-off and positive rate of climb established

3. LANDING GEAR..... UP
4. Airspeed.....CLIMB AT V_2 TO V_2 + 10 KT

At safe altitude / minimum 1500ft AGL:

5. Airspeed..... V_2 + 15 KT
6. Flaps ..... UP
7. Airspeed..... V_{SE}
8. Operating Engine ..... ADJUST THRUST AS NECESSARY

NOTE

APR thrust may be maintained for 10 minutes during single-engine operations.

9. Failed engine thrust lever..... IDLE
10. Failed engine FUEL CONTROL ..... OFF
11. Failed ENG BLEED AIR..... OFF
12. Fuel Balance..... MONITOR
13. Affected side HYDRAULIC EMP.....VERIFY ON
14. TCAS ..... TA ONLY
15. Consider APU start as a backup source of electrical power

(Continued)

If no apparent reason exists for engine failure / flameout:

16. Affected engine ..... CONSIDER START

NOTE

See ENGINE RESTART IN FLIGHT, Page II-59

Single Engine Approach and Landing:

17. Autobrakes ..... AS REQUIRED
18. Flaps ..... 20°
19. Landing gear ..... DOWN / 3 GREEN
20. TAWS FLAP OVRD ..... ON
21. Approach speed ..... V_{REF} FOR 20° FLAPS + 5 KT
    For Flaps 20° landing performance see Figure 5-289
22. EXT LTS ..... AS REQUIRED

After landing:

23. Reverse thrust ..... AS REQUIRED ON AVAILABLE ENGINE
24. If required, see EMERGENCY EVACUATION, Page II-87

<<END>>

SINGLE ENGINE FAILURE IN FLIGHT

Engine Fail (C), L or Engine Fail (C), R warning message indicates that the affected engine has flamed out and is inoperative.

1. Affected engine .....IDENTIFY AND CONFIRM
2. Operating engine thrust lever..... SET CLIMB
3. Inoperative engine thrust lever..... IDLE
4. Affected engine parameters..... MONITOR

NOTE

The auto-throttle will disengage; it is possible to re-engage and use the auto-throttle during single engine operations.

If a re-start can be attempted:

Perform ENGINE RESTART IN FLIGHT, page II-59

If a re-start cannot be attempted:

perform ENGINE SHUTDOWN IN FLIGHT, page II-57

<<END>>

ENGINE EXCEEDANCE

Engine Exceedance, L, Engine Exceedance, R or Engine Exceedance, L-R warning message indicates that N_1, N_2 or ITT parameters exceeded maximum value.

1. Affected engine thrust lever ..... IDENTIFY AND CONFIRM
2. Affected engine thrust lever ..... REDUCE THRUST TO MAINTAIN ENGINE PARAMETER(S) WITHIN LIMITS
3. Engine Event ..... PRESS

If engine parameters CANNOT be controlled within limits:

4. Shut down the affected engine - perform ENGINE SHUTDOWN IN FLIGHT, Page II-57

If engine parameters CAN be controlled within limits:

5. Flight ..... CONTINUE
6. Affected engine parameters ..... MONITOR

<<END>>

ENGINE SHUTDOWN IN FLIGHT

CAUTION

FOR TRAINING/FLIGHT TEST PURPOSES, THE SHUT-DOWN ENGINE SHOULD BE RE-STARTED AS SOON AS PRACTICABLE (TO AVOID THERMAL SHOCKS).

1. Thrust lever ..... ADJUST AS NECESSARY

NOTE

The autothrottle disengages due to the engine failure. It is possible to re-engage and use the autothrottle in single engine operation.

2. Affected engine .....IDENTIFY AND CONFIRM

CAUTION

FOR TRAINING PURPOSES ONLY, SET ENGINE THRUST LEVER TO IDLE FOR 3 MINUTES MINIMUM PRIOR TO SHUT DOWN.

3. Affected engine thrust lever ..... IDLE
4. Affected engine GEN ..... OFF
5. Both WAI switches ..... OFF
6. Affected ENG BLEED ..... OFF
7. Affected HYDRAULIC EMP ..... ON
8. Engine FUEL CONTROL ..... OFF

NOTE

The APU may be used as an alternate source of electrical power, if desired. See APU START (IN FLIGHT), Page IV-12.

(Continued)

9. Affected engine FUEL STBY PUMP.....OFF
10. TCAS..... TA ONLY
11. Fuel synoptic page.....DISPLAY
12. Fuel load balance.....MONITOR
13. If WAI activation is required proceed to - WING ANTI ICE OPERATION ON SINGLE SOURCE, Page IIIA-188
14. Perform SINGLE-ENGINE APPROACH AND LANDING, Page II-66

<<END>>

ENGINE RESTART IN FLIGHT

WARNING

AN AIR START SHOULD NOT BE ATTEMPTED FOLLOWING AN ENGINE FAILURE ACCOMPANIED BY INDICATIONS THAT INTERNAL DAMAGE HAS OCCURRED. SUCH ATTEMPT MAY RESULT IN AN ENGINE FIRE OR FURTHER DAMAGE.

CAUTION

FOR TRAINING/FLIGHT TEST PURPOSES, THE SHUT-DOWN ENGINE SHOULD BE RE-STARTED AS SOON AS PRACTICABLE (TO AVOID THERMAL SHOCKS).

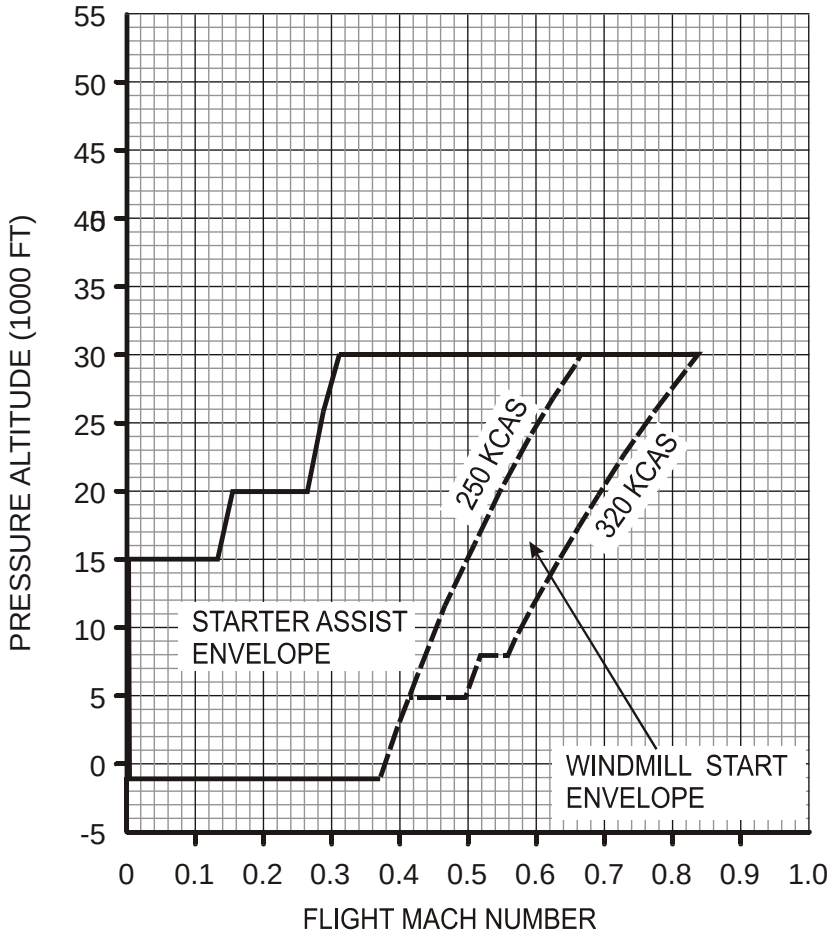

Figure 2-3. Engine Start Envelope

A. STARTER-ASSIST AIR-START (CROSS-BLEED)

CAUTION

IMMEDIATELY ABORT START BY SELECTING THE FUEL CONTROL SWITCH TO OFF IF:

A, LIGHT-OFF DOES NOT OCCUR WITHIN 45 SECONDS.

B, OIL PRESSURE IS NOT INDICATED BY 30% N_2.

C, ITT EXCEEDS LIMITS.

D, WAIT 10 SECONDS BEFORE ATTEMPTING ANOTHER START. NO MORE THAN 3 CONSECUTIVE STARTER-ASSIST AIR STARTS SHOULD BE ATTEMPTED.

E, IF RESTART IS ATTEMPTED AFTER COLD SOAK, WINDMILLING, LOW FUEL TEMPERATURES MAY RESULT IN ENGINE FUEL FILTER BLOCKAGE DUE TO ICING PRIOR TO ENGINE ATTAINING NORMAL OPERATING TEMPERATURE.

F, AN AIR START HAS A POTENTIAL TO RESULT IN AN ITT EXCEEDANCE, IF N_2 IS BELOW 40% AND ITT IS ABOVE 450°C AND RISING.

(Continued)

1. Affected engine FUEL CONTROL.....OFF
2. Affected engine thrust lever .....IDLE
3. Affected ENG BLEED .....OFF
4. ISOLATION valve.....OPEN
5. Bleed air pressure.....VERIFY 32 PSI MINIMUM
6. Affected engine FUEL STBY PUMP.....ON
7. Affected engine FUEL CONTROL.....RUN
8. Affected engine START/CRANK .....PRESS

NOTE

Pack Off caution message comes on during start sequence.

9. Affected Engine parameters and starting sequence .....MONITOR

NOTE

Approximately halfway through the restart, the ITT drops rapidly before increasing again.

If re-start is successful, continue to step 35 *(*D. AFTER START*)*

If re-start is unsuccessful (No N_2, no ITT rise indication) within 50 seconds after start:

10. Affected Engine FUEL CONTROL switch .....OFF
11. Attempt another air-start or see ENGINE SHUTDOWN IN FLIGHT, page II-57

B. WINDMILLING AIR-START

CAUTION

IMMEDIATELY ABORT START BY SELECTING THE FUEL CONTROL SWITCH TO OFF IF:

A, LIGHT-OFF DOES NOT OCCUR WITHIN 45 SECONDS.
B, OIL PRESSURE IS NOT INDICATED BY 30% N_2.
C, ITT EXCEEDS LIMITS.
D, WAIT 10 SECONDS BEFORE ATTEMPTING ANOTHER START.
E, NO MORE THAN 3 CONSECUTIVE STARTER-ASSIST AIR STARTS SHOULD BE ATTEMPTED.
F, AN AIR START HAS A POTENTIAL TO RESULT IN AN ITT EXCEEDANCE, IF N_2 IS BELOW 40% AND ITT IS ABOVE 450°C AND RISING.

12. Affected engine FUEL CONTROL..... OFF
13. Airspeed / altitude ..... 250-320 KCAS / BELOW 30,000 ft
14. Affected engine thrust lever ..... IDLE
15. Affected ENG BLEED ..... OFF
16. Affected engine FUEL STBY PUMP ..... ON
17. N_2..... 8.2% MIN
18. Affected engine FUEL CONTROL..... RUN

(Continued)

19. Affected engine parameters and starting sequence..... MONITOR

NOTE

During Windmill engine start, monitor N_2 constant rise until it stabilizes at idle. Restart may take up to two minutes.

If re-start is successful, continue to step 35 *(*D. AFTER START*)*

If re-start is unsuccessful (no N_2, ITT rise indication):

20. Affected engine FUEL CONTROL.....OFF
21. Attempt another air-start or refer to ENGINE SHUTDOWN IN FLIGHT, Page II-57

C. APU-ASSIST AIR-START (BELOW 15,000 FT)

22. Affected engine FUEL CONTROL.....OFF
23. Right engine FUEL STBY PUMP .....ON
24. APU MASTER.....ON
25. APU START .....PRESS
26. Both ENG BLEED .....VERIFY OFF
27. APU BLEED ..... ON; VERIFY ISOLATION OPEN
28. Bleed pressure..... 22 PSI MIN AT 15,000 FT
29. Affected engine FUEL STBY PUMP.....ON
30. Affected engine FUEL CONTROL..... RUN
31. Affected engine START/CRANK .....PRESS
32. Engine parameters and starting sequence ..... MONITOR

If re-start is successful, continue to step 35 (D - AFTER START).

If re-start is unsuccessful (No N_2, no ITT rise indication) within 50 seconds after start:

33. Engine FUEL CONTROL .....OFF
34. Attempt another air-start or refer to ENGINE SHUTDOWN IN FLIGHT, Page II-57

D. AFTER START

CAUTION

IF CONDITIONS PERMIT, MAINTAIN RE-STARTED ENGINE AT IDLE FOR ONE (1) MINUTE.

35. Restarted engine thrust lever ..... ADVANCE AS REQUIRED
36. ISOLATION valve..... CLOSE
37. Affected ENG BLEED ..... ON
38. Affected engine GEN ..... ON
39. APU BLEED ..... OFF
40. Affected engine FUEL STBY PUMP ON..... OFF
41. Affected engine FUEL STBY PUMP OFF/ARM ... NOT ARM THEN ARM
42. Affected engine HYD EMP..... VERIFY OFF AND ARM
43. Fuel balance ..... MONITOR
44. APU..... AS REQUIRED

<<END>>

SINGLE-ENGINE APPROACH AND LANDING

NOTE

The auto-throttle disengages. It is possible to re-engage and use the auto-throttle during single engine operations.

1. Affected side HYDRAULIC EMP ..... VERIFY ON

Before Descent:

2. Fuel quantity and balance ..... CHECK
3. WING and ENG ANTI-ICE ..... AS REQUIRED
4. ATIS ..... RECEIVED
5. FMS ..... ARRIVAL AND APPROACH SET
6. MDA / DA ..... SET
7. Landing data ..... COMPUTE AND SET
8. V_{REF} ..... SET
   For Flaps 20° landing performance see Figure 5-289
9. Approach briefing ..... COMPLETE

Descent transition:

10. Altimeters ..... SET
11. Landing field elevation ..... CONFIRM
12. Engine Instruments ..... MONITOR
13. CPCS ..... MONITOR
14. Cockpit / cabin / EXT LTS ..... AS REQUIRED

(Continued)

Before landing:

15. Autobrakes ..... AS REQUIRED
16. Flaps ..... 20°
17. Landing gear ..... DOWN / 3 GREEN
18. TAWS FLAP OVRD ..... ON
19. Approach speed ..... V_{REF} FOR 20° FLAPS + 5 KT
20. EXT LTS ..... AS REQUIRED

After landing:

21. Reverse thrust ..... AS REQUIRED ON AVAILABLE ENGINE
22. If required, see EMERGENCY EVACUATION, Page II-87

<<END>>

SINGLE ENGINE GO-AROUND

1. TO/GA button ..... SELECT

NOTE

The A/T system, if engaged, automatically advances to T/O thrust, and the autopilot, if engaged, will remain engaged and execute an automatic go-around. Target speed selection is based upon flap handle position (AUTO mode) or speed bug (MAN mode). Missed approach is activated on FMS and NAV source automatically swaps to FMS if automatic swap from FMS to NAV occurred at beginning of the approach.

2. Thrust lever .....MAXIMUM THRUST (VERIFY APR); press APR pushbutton if required
3. Airspeed ..... V_{REF}
4. Flaps ..... 20°

Once go-around attitude and positive rate of climb are established:

5. Landing gear ..... RETRACT

At safe altitude:

6. Airspeed ..... V_{REF}+20 KT
7. Flaps ..... UP
8. Airspeed ..... V_{REF}+30 KT
9. Thrust ..... AS REQUIRED

NOTE

APR thrust may be maintained for 10 minutes during single-engine operations as needed. Thrust should then be reduced to CLB thrust.

<<END>>

DUAL ENGINE FAILURE

Engine Fail (C), L-R warning message indicates that both engines have flamed-out and are inoperative.

1. Divert to the nearest suitable landing site
2. Crew oxygen masks..... DON, 100%
3. Crew communication .....ESTABLISH
4. Passenger oxygen masks..... SELECT BYPASS

NOTE

With both engines out, there is a diminished hydraulic power to the flight controls. Use STAB trim as necessary to maintain required airspeed.

5. Airspeed..... V_{MO} / 0.77M_i UNTIL WITHIN AIR START ENVELOPE AND CAB ALT BELOW 15,000 FT;
   See Figure 2-3., Engine Start Envelope, Page II-60

CAUTION

1. DUTCH ROLL MAY DEVELOP ABOVE 25,000 FT / 250 KCAS / 0.70 M_i. COUNTER ACT USING CONTROL WHEEL. IF HYDRAULIC IS RESTORED - VERIFY YAW DAMPER ENGAGED.
2. MACH TRIM IS INOPERATIVE. MAINTAIN BELOW 0.77 M_i.

6. Inhibit R CDU tuning ..... SMC-UTIL-TUNE REV - R CDU
7. Transponder.....SELECT ATC 2, SET 7700
8. ATC ..... DECLARE EMERGENCY
9. Both HYDRAULIC EMP ..... OFF AND NOT ARM
10. Both Engine GEN..... OFF
11. Both ENG BLEED ..... OFF

(Continued)

12. If engines remains failed:
    a. Engine FUEL CONTROL .....OFF
    b. Both fuel STBY PUMPS..... OFF AND NOT ARM

CAUTION

THE FOLLOWING APPLY FOR BATTERY - ONLY OPERATION:

- USE OF BOTH FUEL STBY PUMPS IS LIMITED TO 11 MINUTES.
- USE OF SINGLE HYDRAULIC EMP IS LIMITED TO 4 MINUTES.
- USE OF PROBE HEAT (OVRD) IS LIMITED TO 7 MINUTES.

NOTE

If during the procedure one generator becomes operative - no time restriction for FUEL STBY PUMPs and HYDRAULIC EMPs.

13. Consider APU Start (Below 35,000)

CAUTION

PERFORM A MAXIMUM OF 3 APU START ATTEMPTS. ADDITIONAL ATTEMPTS WILL REDUCE BATTERY-ONLY OPERATING TIME.

14. If APU GEN is online:
    a. Both HYDRAULIC EMP .....ON
    b. Yaw damper ..... VERIFY ON

If windmill start is not an option or unsuccessful, and APU unavailable. proceed to step 40

(Continued)

Below 30,000 and altitude permits - accelerate above 250 KCAS, and attempt windmill starts:

15. Airspeed / Altitude ..... 250-320 KCAS / BELOW 30,000 ft
16. Both thrust levers ..... IDLE
17. Both engines FUEL STBY PUMP ..... ON
18. N_2 ..... 8.2% MINIMUM
19. Both engines FUEL CONTROL ..... RUN

CAUTION

IMMEDIATELY ABORT START BY SELECTING THE FUEL CONTROL SWITCH TO OFF IF:

- LIGHT-OFF DOES NOT OCCUR WITHIN 45 SECONDS.
- OIL PRESSURE IS NOT INDICATED BY 30% N_2.
- ITT EXCEEDS LIMITS.
- WAIT 10 SECONDS BEFORE ATTEMPTING ANOTHER START.

NOTE

During windmilling engine start, monitor N_2 constant rise until it stabilizes at idle. Restart may take up to two minutes.

If only one engine started successfully:

20. Engine GEN ..... ON
21. Both HYDRAULIC EMPs ..... ARM
22. ENG BLEED ..... ON
23. Start second engine, using cross bleed air start; perform ENGINE RESTART IN FLIGHT, Page II-59

(Continued)

If Both engine started successfully:

24. Both engines GEN .....ON
25. Both HYDRAULIC EMPs .....ARM
26. Both FUEL STBY PUMPs .....OFF AND ARM
27. Both ENG BLEED .....ON
28. APU BLEED .....OFF
29. Land at nearest suitable airport.

If engines start was unsuccessful and APU is running - below 15,000 ft. perform APU starter-assisted air start:

First engine:

30. Fuel STBY PUMP.....ON
31. Engine FUEL CONTROL .....RUN
32. Engine START/CRANK.....PRESS
33. Engine Parameters .....MONITOR

If engine restart is successful:

34. Engine GEN .....ON
35. Both HYDRAULIC EMPs .....ARM
36. ENG BLEED .....ON
37. Start second engine, using cross bleed air start; perform ENGINE RESTART IN FLIGHT, Page II-59

If restart of BOTH engines is unsuccessful:

38. Maintain best glide speed .....160 KCAS FOR 27,000 LB GW
    ADD 3 KT FOR EVERY 1000 LB
39. Both engines FUEL CONTROL.....OFF
40. Both fuel STBY PUMPS.....OFF
    (LEAVE R FUEL STBY PUMP ON IF APU OPERATING)
41. BOTH HYDRAULIC EMP.....OFF

NOTE

If APU GEN is online, leave EMPs on.

42. Perform DUAL ENGINE FAILURE EMERGENCY LANDING, Page II-73

<<END>>

DUAL ENGINE FAILURE EMERGENCY LANDING

Use this procedure only if no option to perform an air start. Otherwise see DUAL ENGINE FAILURE, Page II-69.

1. Airspeed ..... 160 KCAS FOR 27,000 LB GROSS WEIGHT; ADD 3 KT FOR EVERY 1000 LB
2. ATC ..... NOTIFY

If ditching is to be performed – see DITCHING, page II-85

3. Diversion ..... SELECT SUITABLE SITE
4. EMER BUS ..... BATT ON

NOTE

Windmilling N_2 rpm as low as 6% provides sufficient flight control power for safe flight. If engine(s) was shut down using the FIRE handle, it is necessary to reset the handle to restore hydraulic power. Prior to resetting the FIRE handle, the associated FUEL CONTROL switch must be OFF to prevent fuel from being introduced into the engine.

5. Passengers ..... BRIEFED and PREPARED
6. CAS aural messages ..... INHIBIT IF DESIRED (SMC - TEST)
7. Field ELEV ..... SET 8000 ft (SMC-UTIL-CPCS-MAN)

(Continued)

Reference flameout landing pattern figure below for target altitudes, airspeeds and flaps settings.

8. Enter landing pattern ..... ESTABLISH 3,000 ft AGL DIRECTLY ABOVE INTENDED POINT OF TOUCHDOWN

NOTE

Perform 180 degree turns using 30 degree bank angle.

CAUTION

IF APU GEN IS FAILED OR INOPERATIVE - OPERATING L EMP LONGER THAN REQUIRED WILL DECREASE BATTERY POWER.
FLAPS EXTENSION TIME IS DOUBLED DUE TO LOAD SHEDDING LOGIC OF THE FLAPS CONTROLLER. EXPECT 60 SECONDS FROM ZERO (0) FLAPS TO LND POSITION.

9. L HYDRAULIC EMP ..... ON; EXTEND FLAPS: OFF

NOTE

If APU GEN is online, leave EMP on.

10. R HYDRAULIC EMP ..... ON; EXTEND LG; OFF

NOTE

If APU GEN is online, leave EMP on.

(Continued)

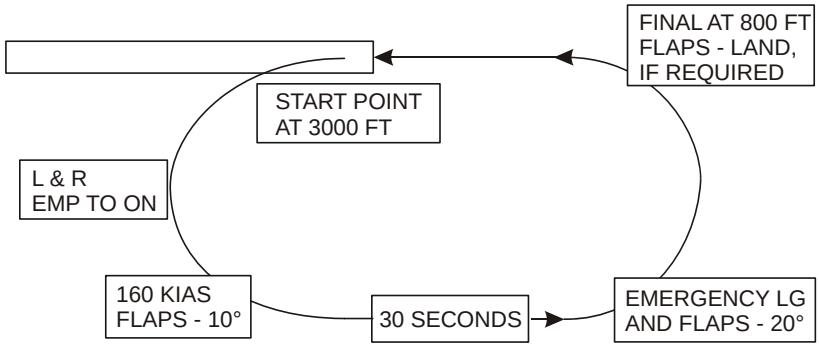
If emergency landing gear extension is not required, proceed to step 12

11. Landing gear ..... EMERGENCY EXTENSION BEFORE TURNING TO FINAL
    a. Landing Gear Lever ..... DOWN
    b. EMERGENCY GEAR DOWN Handle ... RELEASE, TURN AND LIFT
12. Landing Gear ..... VERIFY DOWN / 3 GREEN
13. Airspeed ..... V_{REF} + 10 KT
14. R HYDRAULIC EMP ..... VERIFY ON HYDRAULIC PRESSURE FOR NWS AND WHEEL BRAKES
15. Plan to touchdown within first third of runway.

After Touch-Down:

16. Wheel brakes ..... APPLY AS REQUIRED
17. Perform EMERGENCY EVACUATION, Page II-87

Flameout landing pattern:



<<END>>

ENGINE OIL PRESSURE LOW

If ENG Oil PRESS Low, L, ENG Oil PRESS Low, R or ENG Oil PRESS Low, L-R warning message indicates that oil pressure is below limit.

1. Affected engine thrust lever ..... IDLE
2. Affected engine oil temperature ..... MONITOR

If message goes out and oil pressure and temperature are within limits:

3. Land at nearest suitable airport
4. See SINGLE-ENGINE APPROACH AND LANDING, page II-66

If the message does not go out or indicated oil pressure is below limits or indicated oil temperature is high:

5. Affected Engine..... SHUTDOWN; see ENGINE SHUTDOWN IN FLIGHT, page II-57

CAUTION

ONCE AN ENGINE HAS BEEN SHUT DOWN DUE TO LOW OIL PRESSURE, IT SHOULD NOT BE RESTARTED.

<<END>>

THRUST REVERSER UNLOCKED OR DEPLOYED DURING TAKEOFF

Thrust REV Unlock, L, Thrust REV Unlock, R or Thrust REV Unlock, L-R warning message indicates that a thrust reverser is unsafe or deployed in flight.

Below V_1:

1. Abort takeoff

Above V_1:

2. Affected engine thrust lever ..... IDLE
3. Affected thrust reverser lever ..... VERIFY STOWED
4. Unaffected engine thrust ..... APR / VERIFY APR ON
5. Auto-throttles ..... DISCONNECT
6. At V_R ..... ROTATE
7. Positive rate ..... GEAR UP
8. Airspeed ..... DO NOT EXCEED 200 KCAS

If message does not go out or other indications of thrust reverser deployment are present (buffeting, excessive pitch, roll, yaw), T/R buckets are believed to be actually deployed.

CAUTION

1. IN ANY SITUATION WHERE A REVERSER DOES NOT STOW, THE AFFECTED ENGINE SHOULD BE SHUT DOWN ONLY IF REQUIRED TO MAINTAIN LEVEL FLIGHT AND ABOVE 400FT AGL ONLY.
   UNDER CERTAIN GROSS WEIGHT AND ATMOSPHERIC CONDITIONS, A SUCCESSFUL GO-AROUND MAY NOT BE POSSIBLE.

(Continued)

9. Affected engine ..... IDENTIFY AND CONFIRM
10. Affected thrust lever ..... IDLE
11. Affected engine FUEL CONTROL..... OFF
12. Affected ENG BLEED ..... OFF
13. LAND AS SOON AS POSSIBLE
14. PERFORM LANDING WITH THRUST REVERSER DEPLOYED, page II-81

<<END>>

THRUST REVERSER UNLOCKED OR DEPLOYED IN FLIGHT

Thrust REV Unlock, L, Thrust REV Unlock, R or Thrust REV Unlock, L-R warning message indicates that a thrust reverser is unsafe or deployed in flight.

1. Affected engine thrust lever ..... IDLE
2. Thrust reverser levers ..... VERIFY STOWED
3. Auto-throttles..... DISCONNECT
4. Airspeed..... BELOW 200 KCAS
5. Flaps .....LIMIT TO 20°
6. Calculate landing performance according to APPROACH AND LANDING - ABNORMAL FLAP SETTINGS

Flaps position	Performance figures: Landing Weight Limitation / V_{REF} / Actual Landing Distance
0°	Figure 5-297
10°	Figure 5-293
20°	Figure 5-289

7. TAWS/FLAPS OVRD .....ON

If failure clears:

8. Land at nearest suitable airport
9. Thrust reversers.....DO NOT USE

(Continued)

If message does not go out or other indications of thrust reverser deployment are present (buffeting, excessive pitch, roll, yaw), T/R buckets are believed to be actually deployed.

CAUTION

1. IN ANY SITUATION WHERE A REVERSER DOES NOT STOW, THE AFFECTED ENGINE SHOULD BE SHUT DOWN ONLY IF REQUIRED TO MAINTAIN LEVEL FLIGHT AND ABOVE 400FT AGL ONLY.
   UNDER CERTAIN GROSS WEIGHT AND ATMOSPHERIC CONDITIONS, A SUCCESSFUL GO-AROUND MAY NOT BE POSSIBLE.

10. Affected engine ..... IDENTIFY AND CONFIRM
11. Affected thrust lever ..... IDLE
12. Affected engine FUEL CONTROL..... OFF
13. Affected ENG BLEED ..... OFF
14. LAND AS SOON AS POSSIBLE
15. PERFORM LANDING WITH THRUST REVERSER DEPLOYED, page II-81

<<END>>

LANDING WITH THRUST REVERSER DEPLOYED

Thrust REV Unlock, L, Thrust REV Unlock, R or Thrust REV Unlock, L-R warning message indicates that a thrust reverser is unsafe or deployed in flight.

NOTE

Prefer to land with a crosswind from the unaffected side.

Before landing:

1. PARK BRAKE ..... OFF
2. Auto-brakes ..... HIGH
3. Flaps ..... 20°
4. Calculate landing performance according to APPROACH AND LANDING - ABNORMAL FLAP SETTINGS

Flaps position	Performance figures: Landing Weight Limitation / V_{REF} / Actual Landing Distance
0°	Figure 5-297
10°	Figure 5-293
20°	Figure 5-289

5. Landing gear ..... DOWN / 3 GREEN
6. Airspeed ..... V_{REF} FOR FLAPS - 20°, + 5 KT
7. Autopilot ..... DISCONNECT

After touch down and aircraft nose lowered:

8. Wheel brakes ..... AS REQUIRED
9. Available engine thrust reverser ..... USE AT IDLE

<<END>>

MISCELLANEOUS

IMMEDIATE RETURN FOR LANDING

If an immediate return to the departure airport is required for any reason, the landing should be accomplished using 39° flaps (if available) and the longest runway available.

NOTE

If less than 39° flaps are to be used for landing, the flight crew should consider runway length requirements, brake energy requirements and tire speed limitations. If there is any doubt, the flight crew should consider diversion to an airport with a longer runway or delaying landing until a lower landing weight is attained. Use fuel jettison as practicable,

1. Runway .....USE LONGEST AVAILABLE

If landing with flaps less than 39°:

2. TAWS FLAP OVRD.....ON
3. Final approach speed..... V_{REF} + 5 KT
4. Touchdown .....FIRST 1000 FT OF RUNWAY
5. Sink rate / crab angle ..... MINIMIZE PRIOR TO TOUCHDOWN
6. Reverse thrust..... USE MAXIMUM AVAILABLE PRIOR TO USING BRAKES
7. Brakes temperature..... MONITOR

NOTE

Log for maintenance if overweight landing was performed.

<<END>>

FORCED LANDING OVER LAND

Preparations:

1. Communication ..... "MAYDAY" X 3
2. Transponder 7700
3. ATC 2 ..... SELECT (CDU - TUNE - ATC/TCAS PAGE)
4. ELT switch ..... ON
5. FUEL JETTISON ..... USE TO REDUCE TO MINIMUM WEIGHT
6. Passengers ..... BRIEFED AND PREPARED
7. Cabin luggage ..... SECURED
8. Seat belts, shoulder harnesses ..... FASTENED
9. Both ENG BLEED ..... OFF BELOW 13,000 FT
10. Field ELEV ..... SET 8000 ft (SMC-UTIL-CPCS-MAN)
11. TAWS/FLAPS OVRD ..... ON
12. TAWS/VOICE OVRD ..... ON
13. TERR INIHIBIT ..... PRESS
14. CAS aural messages ..... INHIBIT IF DESIRED (SMC - TEST)

Approach:

15. EMER LTS ..... ON
16. CPCS DUMP ..... SELECT BELOW 2000 FT
17. FUEL JETTISON ..... OFF
18. Landing gear ..... AS DESIRED
    (based on available landing surface)
19. Flaps ..... LND
20. Airspeed bug ..... V_{REF}

Final:

21. Final approach ..... TOWARDS FLAT TERRAIN
22. Descent rate ..... APPROXIMATELY 200 FT PER MINUTE
23. Touchdown ..... NOSE UP SLIGHTLY, MINIMUM FORWARD SPEED AND MINIMUM SINK RATE. WINGS LEVELED

After airplane has stopped:

24. APU Master ..... OFF
25. Both Fuel Controls ..... OFF
26. Both Fire Handles ..... PULL
27. Both BATT ..... OFF

28. STBY BATT ..... OFF
29. Emergency escape window ..... OPEN
30. Main entry door ..... AS REQUIRED
31. Passengers evacuation ..... INITIATE

<<END>>

DITCHING

Preparations:

1. Communication ..... "MAYDAY" X 3
2. Transponder 7700
3. ATC 2 ..... SELECT (CDU - TUNE - ATC/TCAS PAGE)
4. ELT switch ..... ON
5. FUEL JETTISON..... USE TO REDUCE TO MINIMUM WEIGHT
6. Passengers ..... BRIEFED AND PREPARED
7. Cabin luggage ..... SECURED
8. Life vests, shoulder harness ..... FASTENED

WARNING

INFLATE LIFE-VESTS ONLY AFTER EXITING AIRCRAFT.

9. Both ENG BLEED ..... OFF BELOW 13,000 FT
10. Field ELEV ..... SET 8000 ft (SMC-UTIL-CPCS-MAN)
11. TAWS/FLAPS OVRD ..... ON
12. TAWS/VOICE OVRD ..... ON
13. TERR INIHIBIT ..... PRESS
14. CAS aural messages ..... INHIBIT IF DESIRED (SMC - TEST)

Approach:

15. EMER LTS ..... ON
16. DITCH ..... SELECT BELOW 2000 FT
17. FUEL JETTISON..... OFF
18. Landing gear ..... UP
19. Flaps ..... LND
20. Airspeed bug ..... V_{REF}

Final:

21. Final approach ..... PARALLEL TO SWELL
22. Descent rate..... APPROXIMATELY 200 FT PER MINUTE
23. Touchdown..... NOSE UP SLIGHTLY, MINIMUM FORWARD SPEED AND MINIMUM SINK RATE. WINGS LEVELED

(Continued)

After Ditching:

24. Both fire handles ..... PULL

CREW DUTIES DURING DITCHING:

TRAINED CABIN CREWMEMBER (IF ABOARD)

1. If time permits, gather first aid kit, blankets, food, garbage bags, etc., to supply life rafts.
2. Retrieve all Life Rafts from stowed positions.
3. Secure life raft mooring lines to fastened seat belts near the emergency exit.

When directed by the Captain:

4. Follow mooring line to board Life Raft..
5. Direct evacuation from inside airplane. Assist passengers.

FIRST OFFICER

1. Emergency Locator Transmitter (ELT) .....ON
2. Life Rafts ..... REMOVE FROM STOWED POSITION
   Tie life raft mooring line to a fastened seat belt at emergency exit..
3. Emergency Exit Window ..... REMOVE AND DEPLOY LIFE RAFT OUT WINDOW
4. Follow mooring line to board Life Raft.
5. Direct and assist passengers with following mooring lines to board Life Rafts.

CAPTAIN

1. Any remaining life rafts..... REMOVE FROM STOWED POSITION
   Tie life raft mooring line to fastened seat belt at emergency exit.
2. Emergency Exit Window (if still closed) .. REMOVE AND DEPLOY LIFE RAFT OUT WINDOW
3. Direct passengers to follow mooring line to Life Rafts.
4. Verify all passengers have disembarked the airplane prior to boarding the Life Raft.

<<END>>

EMERGENCY EVACUATION

1. ATC ..... ADVISE
2. PARK BRAKE ..... SET
3. Speed brake..... VERIFY RETRACTED
4. Both FUEL CONTROL ..... OFF
5. APU MASTER (If running) ..... OFF
6. EMER LTS ..... ON
7. Main entrance door / emergency exit ..... OPEN AS REQUIRED

If engine fire is suspected:

8. Both fire handles ..... PULL
9. Affected engine fire handles ..... ROTATE FULLY TO DISCH 1 / DISCH 2

NOTE

To discharge fire bottles into both engines, rotate both handles in the same direction (either both left or both right).

10. Both BATTs ..... OFF
11. STBY BATT ..... OFF
12. Passengers evacuation..... INITIATE

If engine fire is not suspected:

13. Both BATT ..... OFF
14. STBY BATT ..... OFF
15. Passengers evacuation..... INITIATE

<<END>>

SA (SITUATIONAL AWARENESS) CAS MESSAGE IIIB-1

ADVISORY MESSAGES (CYAN) IIIB-2

EICAS STATUS MESSAGES IIIC-1

STATUS MESSAGES (WHITE) IIIC-2

EICAS CAUTION MESSAGES

Following is a ready-reference guide which briefly outlines the message meaning and action to be taken when a message comes on. It also refers to subject, section and page where more detailed information and procedures are found.

Procedures are grouped by actions. There can be separate procedures for Left (L) system failure, Right (R) system failure and both (L-R) systems failure, or one procedure for both left or right or both system failure as follows:
L/R - (L) or (R)
L-R - (L and R)
L/R/L-R - (L) or (R) or (L and R)

COLLECTOR CAS MESSAGE

If a major failure causes failures of other systems, in order to minimize crew workload and direct the crew to the exact identification of the main failure, it will be marked with (C) as for a collector CAS message. When a collector CAS come on, it may have SA (situational awareness) CAS associated below it in the EICAS window. The collector procedure is designed to take the crew through all action down to landing and include implications of masked and SA CAS message.

SA (SITUATIONAL AWARENESS) CAS MESSAGE

When a collector CAS message comes on, most of the failures that are caused or derived from this failure are masked. Failures that are regarded as important for crew situational awareness will be marked with a caret (**>**) on its left and have no associated checklist box. These SA CAS messages are intended to notify the crew that the collector failure causes a degradation in: flight envelope, pressurization control, environmental control, flight and ground control, and loss of annunciation or alert capabilities.

(Continued)

NOTE

1. Takeoff is prohibited unless relief for the Caution CAS message is provided by an approved MEL.
2. MASTER CAUTION lights (pilot and copilot) illuminate when any caution (amber) message is initially displayed.
3. When any message comes on, check appropriate switches and circuit breakers.
4. Some caution messages are automatically inhibited from 80 kt on takeoff, and some are inhibited automatically from thrust lever above 70% N_1. The inhibit function ends when aircraft passes 400 ft AGL or 30 seconds after liftoff.
5. Messages having ◄ symbol are accompanied by aural alert.

The action part of a step is defined as the system status (i.e. ON, OFF, MAN, AUTO) followed by the physical switch or pushbutton position in parenthesis (i.e. IN, OUT).

GENERAL GUIDANCE

Should any abnormal event occur, the following shall apply:

- Maintain control of the airplane
- Other than retracting the landing gear and silencing aural warnings, take no action until above 400 ft AGL.
- If a warning (red) or caution (amber) CAS message occurs between the FAF and the runway, the crew should consider a go around to allow time to read and perform the appropriate procedure prior to landing unless conditions dictate otherwise.
- Resetting tripped circuit breakers or cycling circuit breakers to recover or reboot systems should be done only if the system is required for continued safe flight and landing, and if required by the emergency or abnormal procedure.

Landing urgency consideration:

Land as soon as possible – Land without delay where a safe approach and landing is assured.

Land at nearest suitable airport – Extended flight beyond the nearest approved airport is not recommended.

Land as soon as practicable – The landing site and duration of the flight are at the discretion of the pilot.

CAUTION MESSAGES (AMBER)

(Sheet 1 of 81)

Message	Triggered by	Corrective Action
A/T 1-2 Fail	Both autothrottles have failed	Control throttles manually
A/T 1-2 Fail-TQA	Throttle Quadrant Assembly does not respond to autothrottle commands	1. Control throttles manually 2. Check TQA CB (O1)
A/T Retard Inhibit	Autothrottle retard function is not available	***If dual Radar ALT installation:*** 1. RADALT - REVERT TO OTHER SYSTEM OR COUPLE TO OPERATING SIDE. (SMC- SNSR- AFCS) ***If failure persist or single RADALT installation:*** 2. At 100 ft AGL - DISCONNECT AUTOTHROTTLE 3. Retard thrust levers as required
ACP 1-2 Fail ACP 1-2-3 Fail	Indicated Audio Control Panel (ACP) has failed	Select emergency mode (EMER) **NOTE:** Selecting EMER mode on the AOP connects directly to the on-side VHF only

CAUTION MESSAGES (AMBER)

(Sheet 2 of 81)

Message	Triggered by	Corrective Action
ACS Air Flow Low	Low flow condition detected in pack	1. Thrust - INCREASE ***If message persists:*** 2. ALTN PRESS - ON NOTE: PACK valve will close automatically 3. See ALTERNATE PRESSURIZATION OPERATION, Page IIIA-91
ACS Fail	Air Conditioning System (ACS) has failed	1. ECS synoptic - DISPLAY 2. GADC 2 cb (K8) - CYCLE 3. ALTN PRESS - ON 4. Continue with ALTERNATE PRESSURIZATION OPERATION, Page IIIA-91
ACS Pack TEMP Low	Pack temperature is below 30°F for 1 minute	See ACS PACK TEMPERATURE LOW, Page IIIA-239
ACS Pack Turbine Hot	Pack outlet is above 160°F or compressor outlet is above 450°F for more than 2 seconds	1. ALTN PRESS - ON **NOTE:** PACK Valve will close automatically 2. ECS synoptic - MONITOR 3. See ALTERNATE PRESSURIZATION OPERATION, Page IIIA-91

CAUTION MESSAGES (AMBER)

(Sheet 3 of 81)

Message	Triggered by	Corrective Action
ADC 1 Fail ADC 2 Fail	Air Data Computer (ADC) has failed (on ground)	***On ground:*** Do not dispatch ***In flight:*** Confirm switch over to cross-side ADC
ADC 1-2 Fail	Air Data Computers (ADC) have failed	***On ground:*** Do not dispatch ***In flight:*** See DUAL ADC FAILURE, Page IIIA-221
ADS 1 Probe Heat Fail ADS 2 Probe Heat Fail ADS 1-2 Probe Heat FL	Indicated pitot tube heater elements failed	See PROBE HEAT FAILURE, Page IIIA-191
ADS-B Out Fail	Transponders are unable to transmit ADS-B OUT information to ground control	Advise ATC of ADS-B failure.

CAUTION MESSAGES (AMBER)

(Sheet 4 of 81)

Message	Triggered by	Corrective Action
AFCS Disconnect Bar	Automatic flight control system function disabled by FCP disconnect bar	1. AFCS DISCON bar position - VERIFY NOTE: AT, AP, YD, mach trim and Stick Pusher are inoperative ***If failure persists:*** 2. Aircraft - DESCEND BELOW 25,000 ft / 250 KCAS / 0.70 M
AFT Radio Rack Hot, R	Right aft radio rack temperature overheats	See RIGHT AFT RADIO RACK HOT, Page II-43
AHS 1 Fail AHS 2 Fail AHS 3 Fail	Indicated AHRS has suffered critical failure on ground	1. Re-enter Present Position to FMS (CDU-INDEX-POS INIT) NOTE: AP and AHS should revert automatically to cross side. 2. AFCS and AHS reversion - VERIFY 3. If AHRS 3 available - SELECT FOR FAILED SIDE (SMC-SNSR) 4. See MMEL

CAUTION MESSAGES (AMBER)

(Sheet 5 of 81)

Message	Triggered by	Corrective Action
AHS 1 Excessive Motion AHS 2 Excessive Motion AHS 3 Excessive Motion AHS 1-2 Excessive Motion AHS 1-3 Excessive Motion AHS 2-3 Excessive Motion AHS Excessive Motion	Ground only: When the AHRS or IRS was undergoing stationary alignment, an excessive motion condition was detected	Taxi below 30 KT until alignment completes NOTE: If the motion continues and GPS groundspeed exceeds 30 kt, the AHS or IRS automatically transition to align in motion
AHS 1-2 Fail AHS 1-2-3 Fail	Indicated AHRS have suffered critical failure	1. Re-enter Present Position to FMS (CDU-INDEX-POS INIT) 2. If AHRS 3 available -.SELECT (SMC-SNSR) ***If AHRS 3 not available:*** 3. Continue with DUAL AHS FAILURE, Page IIIA-228

CAUTION MESSAGES (AMBER)

(Sheet 6 of 81)

Message	Triggered by	Corrective Action
AHS 1-3 Fail AHS 2-3 Fail	Indicated AHRS critical failure has occurred	1. Re-enter Present Position to FMS (CDU-INDEX-POS INIT) 2. Verify valid AHS is selected (SMC-SNSR) 3. Failed AHS cb's - CYCLE NOTE: AHS 1 Cb's - M6, M9 AHS 2 Cb's - M5, M15 AHS 3 Cb's - M4, M14 4. Continue with AHS ALIGNMENT IN FLIGHT, Page IIIA-233
AIL Mistrim ROL Left	Autopilot aileron trim out of left trim	1. Autopilot - DISENGAGE 2. Ailerons - TRIM LEFT 3. Autopilot - ENGAGE
AIL Mistrim ROL Right	Autopilot aileron trim out of right trim	1. Autopilot - DISENGAGE 2. Ailerons - TRIM RIGHT 3. Autopilot - ENGAGE
Aileron Trim Fail	Aileron trim actuator has failed	1. AILERON TRIM cb (F5) - CYCLE 2. Monitor fuel imbalance
Airstairs SOV Open	Airstairs shutoff valve is not fully closed. Door cannot be opened	1. Do not taxi. Wait 60 seconds ***If failure persists:*** 2. Left Engine - SHUT DOWN 3. Left hydraulic EMP - OFF 4. Maintenance action required

CAUTION MESSAGES (AMBER)

(Sheet 7 of 81)

Message	Triggered by	Corrective Action
Alternate Flaps Fail	Flaps alternate channel is not available, or alternate channel was selected and flaps have not achieved flaps lever commanded position for 30 seconds	***If primary flaps are usable:*** 1. ALTN FLAPS - OFF ***If primary flaps are not usable:*** 2. Move lever to previous detent (verify in detent position), then move to desired position ***If failure persists:*** 3. See ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147
Alternate STAB Arm	Alternate stabilizer trim channel is selected	1. ALTN STAB - AS REQUIRED 2. Airspeed - BELOW 270 KCAS / 0.80M_i
Alternate STAB Fail	Alternate channel has failed	***If PRIM STAB cannot be reselected:*** PerformJAMMED HORIZONTAL STABILIZER, Page IIIA-140
ALTN PRESS Fail Close	Alternate pressurization valve failed closed	***If ALTN BLEED is needed and no other bleed source are available:*** Perform CABIN UNDERPRESSURIZATION, Page II-18

CAUTION MESSAGES (AMBER)

(Sheet 8 of 81)

Message	Triggered by	Corrective Action
ALTN PRESS Fail Open	Alternate pressurization valve failed open	***If ALTN BLEED is not required:*** 1. L ENG BLEED - VERIFY ON 2. R ENG BLEED - OFF 3. ISOLATION valve - VERIFY CLOSED 4. ECS synoptic - MONITOR
ALTN PRESS Selected	Alternate pressurization selected ON	See ALTERNATE PRESSURIZATION OPERATION, Page IIIA-91
Anti-skid Fail	Loss of more than one wheel speed transducer. Braking system operates without Anti skid protection.	See ANTI-SKID FAILURE, Page IIIA-196
AOA Miscompare	Angle Of Attack (AOA) indications have gross miscompare. NOTE: This message may occur during high side slip maneuvers and crosswind landings. Message is inhibited on ground	See AOA (ANGLE OF ATTACK) MISCOMPARE, Page IIIA-217

CAUTION MESSAGES (AMBER)

(Sheet 9 of 81)

Message	Triggered by	Corrective Action
AOA Probe Fail, L AOA Probe Fail, R	AOA probe sensor failed (on ground)	Do not dispatch
AOA Probe Fail, L-R	Both AOA probe sensors failed	***On ground*** Do not dispatch ***In air*** Proceed to AOA (ANGLE OF ATTACK) MISCOMPARE, Page IIIA-217
AP 1-2 Fail	Both autopilot (AP) systems have failed	See AUTOPILOT FAILURE, Page IIIA-93 **NOTE**: In case of erratic airspeed indications of two or three airspeed indicators, proceed to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218
AP 1-2 Fail - AIL SRVO	Aileron servo failure. Autopilot unavailable	See AUTOPILOT FAILURE, Page IIIA-93 **NOTE**: In case of erratic airspeed indications of two or three airspeed indicators, proceed to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218

CAUTION MESSAGES (AMBER)

(Sheet 10 of 81)

Message	Triggered by	Corrective Action
AP 1-2 Fail - ELEV SRVO	Elevator servo failure. Autopilot unavailable	See AUTOPILOT FAILURE, Page IIIA-93 **NOTE**: In case of erratic airspeed indications of two or three airspeed indicators, proceed to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218
AP 1-2 Fail - FCP	FCP failure. Autopilot unavailable	1. TAKE MANUAL CONTROL OF AIRCRAFT 2. Descend below 25,000 ft / 250 KCAS /0.70Mi 3. FCP A and B cb's (P1, P11) - CYCLE ***If failure persists:*** 4. Proceed to AUTOPILOT FAILURE, Page IIIA-93. 5. ATC - ADVISE (UNABLE RVSM) NOTE: 1. AP, YD, MT and SP are unavailable 2. BARO correction - SELECT VIA HSI MENU - BARO SET

CAUTION MESSAGES (AMBER)

(Sheet 11 of 81)

Message	Triggered by	Corrective Action
AP Roll Axis Only (C)	A double hydraulic failure has occurred and the autopilot is operating but is only able to provide control in the roll axis	***If yaw damper inoperative:*** 1. Engage autopilot in order to minimize dutch roll 2. Descend to altitude of 25,000 ft / 250 KCAS / 0.70M_i or below 3. Use STAB trim for pitch control (STAB trim will not disengage AP in this mode) NOTE: Autopilot in this mode will not disconnect for Stick shaker event.
AP STAB Trim Fail	STAB trim did not respond to autopilot trim command	1. Mach trim is inoperative - MAINTAIN BELOW 0.77 M 2. See AUTOPILOT FAILURE, page IIIA-93
APM Miscompare	APM (Aircraft Personality Module) settings are mismatched	Maintenance action is required before dispatch
APU Bleed Loop Fail	Failure of one or both bleed loop sensors in the APU bleed leak detection zone	Do not operate APU unless essential
APU Bleed Valve Open	APU load control valve failed to close	1. APU BLEED - ON then OFF ***If failure persists:*** 2. APU - SHUT DOWN

CAUTION MESSAGES (AMBER)

(Sheet 12 of 81)

Message	Triggered by	Corrective Action
APU Door Fail Open	APU door indicates it is open when commanded to close	APU MASTER - Cycle ON; wait for APU Ready advisory message; then OFF NOTE: In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message
APU Essential	APU operating in flight, and an essential mode fault is detected	See APU FAILURES, Page IIIA-242
APU Exceedance	APU RPM or EGT exceedance	See APU EXCEEDANCE, Page IIIA-240
APU Fail	Automatic APU protective shutdown was performed	***When APU RPM less than 5%:*** 1. APU MASTER - OFF ***If no other abnormal indications are present and APU is required:*** 2. Attempt another start
APU Fire Loop Fail	Both loops of the APU fire detection system have failed	Do not operate APU unless essential.

CAUTION MESSAGES (AMBER)

(Sheet 13 of 81)

Message	Triggered by	Corrective Action
APU Fuel SOV Fail	APU fuel shutoff valve failed or not in commanded position or valve data invalid	See APU FUEL SOV FAILURE, Page IIIA-241
APU GCU Fail	APU generator control unit has failed	1. ELECTRICAL synoptic - DISPLAY 2. Electrical RESET - PRESS ***If failure persists:*** 3. APU GCU cb (B19) - RESET (wait 10 seconds between pull and reset) 4. Electrical RESET - PRESS ***If message persists:*** 5. APU GEN - OFF
APU GEN Overload	APU electrical load is exceeded	1. ELECTRICAL synoptic - DISPLAY ***If APU GEN is necessary:*** 2. Electrical loads - REDUCE (CABIN, GALLEY, 60HZ, R WINDSHIELD HEAT) ***If APU GEN is not required:*** 3. APU GEN - OFF

CAUTION MESSAGES (AMBER)

(Sheet 14 of 81)

Message	Triggered by	Corrective Action
APU Generator Fail	APU generator has failed	1. ELECTRICAL synoptic - DISPLAY 2. Electrical RESET - PRESS ***If failure persists:*** 3. APU GCU cb (B19) - RESET (wait 10 seconds between pull and reset) 4. Electrical RESET - PRESS ***If message persists:*** 5. APU GEN- OFF
APU Oil Pressure Low	APU is in ESSENTIAL mode and low oil pressure has been detected. In NON ESSENTIAL mode (on ground) APU automatically shuts down	See APU FAILURES, Page IIIA-242
APU Oil TEMP High	APU is in essential mode and oil temperature is high. In non essential mode (on the ground) APU automatically shuts down	See APU FAILURES, Page IIIA-242

CAUTION MESSAGES (AMBER)

(Sheet 15 of 81)

Message	Triggered by	Corrective Action
APU Starter Engage	APU starter engaged after scheduled starter drop out RPM	***In flight:*** 1. APU STOP - PRESS ***On ground:*** 1. APU STOP - PRESS 2. EXT PWR - SELECT ON ***if message persists:*** 3. Call maintenance to disconnect right battery
ATC 1 Fail ATC 2 Fail	Indicated transponder is selected and has failed.	Select other transponder
ATC 1-2/TCAS Fail	Indicated transponder and Traffic Alert and Collision Avoidance System (TCAS) have failed	***On ground*** Refer to MMEL ***In air*** Notify ATC about Transponder and TCAS failure
Auto APR Inhibit	Auto APR has disarmed	Auto APR Inhibit - AS REQUIRED
AUTO TEMP Fail-Cabin	Cabin automatic temperature control system has failed	CABIN TEMP CONTROL - MAN
AUTO TEMP Fail-CKPT	Cockpit automatic temperature control has failed	COCKPIT TEMP CONTROL - MAN
Autobrake Fail	Auto brakes are not available	Apply manual braking

CAUTION MESSAGES (AMBER)

(Sheet 16 of 81)

Message	Triggered by	Corrective Action
Avionics CONFIG Fault	Invalid Avionics configuration	Check MAINT MGR - system configuration
BAG CMPT PRESS Low	Low pressure in baggage compartment	1. Verify no passengers/crew in baggage compartment 2. Baggage door - VERIFY CLOSED **NOTE:** Once there is a differential pressure between cabin and baggage compartment larger than 0.3 psi - BAG ISO Valve Closed caution message comes on. 3. Descent to maintain DP less than 5.5 psi and cabin altitude less than 7000 ft **CAUTION:** Excessive time with DP above 5.5 psi with no pressurization in baggage compartment may cause structure (bulkhead) deformation.

CAUTION MESSAGES (AMBER)

(Sheet 17 of 81)

Message	Triggered by	Corrective Action
BAG Dump Valve Open	Baggage dump valve is open	1. Verify no passenger is in the baggage compartment 2. Baggage door - VERIFY CLOSED 3. Cabin Altitude - MONITOR **NOTE**: Expect BAG CMPT PRESS Low caution message to come on.
BAG ISO Valve Closed	Baggage isolation valve is closed	**NOTE:** The isolation valve closes when a differential pressure between cabin and baggage compartment is larger than 0.3 psi. 1. Verify no passengers / crew in baggage compartment 2. Internal baggage door - VERIFY CLOSED 3. Cabin altitude - MONITOR ***If*** BAG CMPT PRESS Low ***message comes on:*** 4. Descent to maintain DP less than 5.5 psi and cabin altitude less than 7000 ft **CAUTION:** Excessive time with DP above 5.5 psi with no pressurization in baggage compartment may cause structure (bulkhead) deformation.

CAUTION MESSAGES (AMBER)

(Sheet 18 of 81)

Message	Triggered by	Corrective Action
BAG Smoke DET Fail	Baggage compartment smoke detector has failed	1. Altitude - below 40,000 ft. 2. Keep interior baggage door open
BAS Fail, L-R	Both BLEED AIR Systems (BAS) have failed	See BLEED AIR SYSTEM (BAS) FAILURE, Page IIIA-234
BAS Fail, L BAS Fail, R	Indicated Bleed Air System (BAS) has failed	1. Affected ENG BLEED - CYCLE OFF THEN ON ***If failure persists:*** 2. Affected ENG BLEED - OFF 3. Both WAI - OFF 4. If WAI activation is required - proceed to WING ANTI ICE OPERATION ON SINGLE SOURCE, page IIIA-188
BAS Off, L BAS Off, R BAS Off, L-R	Bleed Air System (BAS) is selected OFF with engine running, parking brake released and APU bleed air not on	1. Indicated ENG BLEED - ON 2. Both WAI - OFF 3. If WAI activation is required - proceed to WING ANTI ICE OPERATION ON SINGLE SOURCE, page IIIA-188

Message	Triggered by	Corrective Action
Bleed PRESS Low, L Bleed PRESS Low, R Bleed PRESS Low, L-R	Indicated bleed pressures is below 5 psi for more than 10 seconds	See BLEED PRESSURE LOW, Page IIIA-235
Brake CTRL Unit Fail	Both Brake Control Unit (BCU) channels have failed. Brake By Wire is inoperative	See BRAKE CONTROL UNIT FAILURE, Page IIIA-197
Brake Overheat	One or more Brake Temperature Measuring System (BTMS) signals higher than 450°C	See BRAKE OVERHEAT, Page IIIA-194
Brakes Fail,L Brakes Fail, R	Indicated side outboard and inboard braking pedals have failed. Only opposite side pedal braking is available	See NO BRAKING ON ONE STRUT, Page IIIA-199
BTL 1 ENG Squibs Fail	Both squibs of fire bottle 1 have failed	***On ground:*** Do not dispatch ***In flight:*** Do not operate APU unless essential

CAUTION MESSAGES (AMBER)

(Sheet 23 of 81)

Message	Triggered by	Corrective Action
BTL 1 L ENG Squib FL	Left engine squib of fire bottle 1 has failed (on ground only)	Do not dispatch
BTL 1 R ENG Squib FL	Right engine squib of fire bottle 1 has failed (on ground only)	Do not dispatch
BTL 2 APU Squib Fail	APU squib of fire bottle 2 has failed.	***On ground:*** Do not dispatch ***In flight:*** Do not operate APU unless essential
BTL 2 ENG Squibs Fail	Left and right engine squibs of fire bottle 2 have failed	***On ground:*** Do not dispatch ***In flight:*** Do not operate APU unless essential
BTL 2 L ENG Squib FL	Left engine squib of fire bottle 2 has failed (on ground only)	Do not dispatch
BTL 2 R ENG Squib FL	Right engine squib of fire bottle 2 has failed (on ground only)	Do not dispatch

CAUTION MESSAGES (AMBER)

(Sheet 24 of 81)

Message	Triggered by	Corrective Action
Cabin Duct TEMP HI	Cabin duct air temperature exceeds 225°F for 10 seconds	1. CABIN TEMP CONTROL - MAN 2. Cabin temperature - REDUCE ***If message persists after 60 seconds:*** 3. Engine thrust - REDUCE 4. If failure persists - Land at the nearest suitable airport
Calibrate RSE	RSE (STBY Instrument Remote Sensor) needs to be calibrated	Do not dispatch
Check Fuel Quantity	Loss of fuel tank quantity indication in any tank	See FUEL MEASUREMENT DEGRADED, Page IIIA-168
Check SMC - Airdata	Miscompare detected between the airspeed or altitude data of the ISI and the PFD	See CHECK SMC AIRDATA, Page IIIA-215

CAUTION MESSAGES (AMBER)

(Sheet 25 of 81)

Message	Triggered by	Corrective Action
Check SMC - Attitude	Miscompare detected between the pitch or roll or yaw data of the ISI and PFD	1. Compare ISI against PFDs 2. Decide which display failed ***If ISI is failed (no attitude display):*** 3. See ISI (Integrated Standby Instrument) Failure, Page IIIA-216 ***If PFD Attitude is failed:*** 4. See AHS 1 Fail, Page IIIB-4, AHS 2 Fail, Page IIIB-4 or AHS 3 Fail, Page IIIB-4 (for respective side
Check SMC - Heading	Standby heading has failed or a miscomparison is detected between the standby sensor data of the ISI and the PFD	1. Compare RSE heading against both PFD heading indications ***If RSE heading displayed on the SMC miscompares with PFD heading indications:*** 2. Select Fast Erect for the standby system ***If ISI heading still miscompares after fast erect alignment:*** 3. HSU CB (P14) - PULL 4. Deselect RSE as heading source on ISI menu

CAUTION MESSAGES (AMBER)

(Sheet 26 of 81)

Message	Triggered by	Corrective Action
Cockpit Duct TEMP HI	Cockpit duct air temperature exceeds 225°F for 10 seconds	1. COCKPIT TEMP CONTROL - MAN 2. COCKPIT temperature - REDUCE ***If failure persists after 60 seconds:*** 3. Engine thrust - REDUCE ***If failure persists:*** 4. Land at nearest suitable airport
Control Sweep REQD	On ground only, elevator jam monitor test not completed	1. Perform elevator control sweep
CPCS Air Flow Low	Cabin altitude increases when outflow valve is fully closed	1. Engine thrust - INCREASE ***If failure persists:*** 2. ALTN PRESS - ON **NOTE:** Pack valve automatically closes 3. Cabin altitude - MONITOR
CPCS Ditch Selected	PRESSURIZATION DITCH pushbutton is selected	DITCH - AS REQUIRED

DISTR Bus Fail (C), L-R	Both distribution DC bus have failed	See L-R (DUAL) DISTRIBUTION BUS FAILURE, Page IIIA-118 **NOTE:** Collector message
DU 1-2 Fail DU 1-3 Fail DU 2-3 Fail	Indicated DUs are failed	Reset DU switches if persist proceed to DUAL / ALL DU OVERHEAT, Page IIIA-227
DU 1 Overheat DU 2 Overheat DU 3 Overheat	Indicated DU is hot	Switch the indicated display off to save it for critical phases of flight
DU 1-2 Overheat DU 1-3 Overheat DU 2-3 Overheat DU 1-2-3 Overheat	Indicated DUs are hot	See DUAL / ALL DU OVERHEAT, Page IIIA-227

CAUTION MESSAGES (AMBER)

(Sheet 30 of 81)

Message	Triggered by	Corrective Action
EDP Pressure Low L EDP Pressure Low R EDP Pressure Low L-R	Message indicates loss of Hydraulic Engine Driven Pump. This CAS is inhibited by Engine Fail (C), Engine Off (C) and HYD SYS Fail (C).	***On ground:*** 1. Refer to MMEL. ***In air:*** 1. Hydraulic synoptic – DISPLAY 2. Onside EMP – ON 3. Descent below 39,000 ft. 4. Hydraulic system oil level and temperature – MONITOR 5. Land at nearest suitable airport. **NOTE**: EMP operation is limited to 10 minutes above 39,000 ft. as per AFM
ELEV Mistrim Nose DN	Autopilot elevator is out of trim in the nose down direction.	1. Hold control wheel firmly, then disengage AP 2. STAB trim - TRIM UP 3. AP - ENGAGE
ELEV Mistrim Nose UP	Autopilot elevator is out of trim in the nose up direction.	1. Hold control wheel firmly, then disengage AP 2. STAB Trim - TRIM DOWN 3. AP - ENGAGE
Elevator Disconnect	Left and right elevators are disconnected	1. See JAMMED ELEVATOR, Page IIIA-136 2. Land at nearest suitable airport **NOTE:** Autopilot is not available

CAUTION MESSAGES (AMBER)

(Sheet 31 of 81)

Message	Triggered by	Corrective Action
Elevator HOPS Fail	On ground only, Hard Over Protection System (HOPS) failure	Do not dispatch
Elevator HYD INOP, L Elevator HYD INOP, R	Indicated elevator hydraulic power disconnected due to hard over protection	**NOTE:** Expect small increase in pitch forces. 1. Airspeed - BELOW V_A 2. Perform normal approach and landing 3. Land as soon as practicable
Elevator HYD INOP, L-R	Both elevators hydraulic power disconnected due to hard over protection	**NOTE:** Elevators are in manual reversion and have limited authority. 1. Airspeed - BELOW V_A 2. Use STAB trim to compensate for high pitch forces 3. Land at nearest suitable airport
ELT Transmitting	Emergency locator transmitter (ELT) is on	1. Verify ELT switch position - ARM 2. If ELT is transmitting when selected ARM - Pull ELT cb (K11)

CAUTION MESSAGES (AMBER)

(Sheet 32 of 81)

Message	Triggered by	Corrective Action
EMER Bus ALT Feed, L EMER Bus ALT Feed, R	Indicated emergency bus is not fed from its normal source	NOTE: Do not reset or pull the following cb's: A7, A8, A17 and A18. 1. Electrical synoptic - DISPLAY 2. Land as soon as practicable
EMER Bus Fail (C), L	Left emergency bus has failed	See L EMERGENCY BUS FAIL, Page IIIA-102 NOTE: Collector message

CAUTION MESSAGES (AMBER)

(Sheet 33 of 81)

Message	Triggered by	Corrective Action
EMER Bus Fail (C), L-R	Both emergency buses have failed	1. ALTN STAB - ARM 2. ALTN PRESS - ON 3. Airspeed/altitude - MAINTAIN BELOW 250 KCAS / 0.70M_i / 25,000 ft 4. Land at nearest suitable airport. CAUTION: 1. AVOID LARGE ATTITUDE CHANGE OR HIGH BANK ANGLES. 2. MACH TRIM AND YAW DAMPER ARE NOT AVAILABLE 3. DEPART/AVOID ICING CONDITIONS. 4. Review R EMERGENCY BUS FAIL, Page IIIA-106 and L EMERGENCY BUS FAIL, Page IIIA-102 prior to landing. **NOTE:** Collector message.
EMER Bus Fail (C), R	Right emergency bus has failed	See R EMERGENCY BUS FAIL, Page IIIA-106 **NOTE:** Collector message

CAUTION MESSAGES (AMBER)

(Sheet 34 of 81)

Message	Triggered by	Corrective Action
Emergency BATT On	EMER BUS pushbutton is selected to BATT ON. Only L and R emergency buses are powered	EMER BUS - AS REQUIRED
Emergency Exit Window	Cabin emergency escape window release handle unlocked	1. Inspect emergency windows and latch 2. Verify positive DP
Emergency Light SW	Switch is not in ARM position or switch is in ON position	Verify EMER LTS position
EMP HYD PRESS Low, L EMP HYD PRESS Low, R EMP HYD PRESS Low, L-R	Indicated hydraulic pressure is below 900 psi when EMP is either on or armed	1. Indicated HYDRAULIC EMP - ON ***If hydraulic pressure remain low Continue with:*** LEFT HYDRAULIC SYSTEM FAILURE, Page IIIA-176 or, RIGHT HYDRAULIC SYSTEM FAILURE, Page IIIA-173 or, LEFT AND RIGHT (DUAL) HYDRAULIC SYSTEMS FAILURE, Page IIIA-179

CAUTION MESSAGES (AMBER)

(Sheet 35 of 81)

Message	Triggered by	Corrective Action
EMP HYD Pump Hot, L EMP HYD Pump Hot, R EMP HYD Pump Hot, L-R	Indicated hydraulic Electric Motor Pump (EMP) overheated	**NOTE:** If failure clears and continued use of EMP is required - descend below 39,000 ft 1. Indicated HYDRAULIC EMP - VERIFY OFF 2. Hydraulic synoptic - MONITOR TEMP
EMP HYD Pump Not Arm, L EMP HYD Pump Not Arm, R EMP HYD Pump Not Arm, L-R	Indicated HYDRAULIC EMP pushbutton not in either ARMED or ON positions	1. HYD EMP OFF/ARM – ARM AS REQUIRED ***In air:*** *If EMP CTRL CB (F1, F11) has popped:* 2. Reset CB only if required for safety of flight. 3. Continue flight. **NOTE:** EMP operation is not possible when circuit breaker out.
ENG A/I PRESS High, L, ENG A/I PRESS High, R ENG A/I PRESS HI, L-R	Excessive pressure condition exists within the indicated engine anti-ice system	1. Affected engine - REDUCE THRUST 2. Affected ENG ANTI ICE selector - OFF 3. Avoid icing conditions

CAUTION MESSAGES (AMBER)

(Sheet 36 of 81)

Message	Triggered by	Corrective Action
ENG A/I Fail On, L ENG A/I Fail On, R ENG A/I Fail On, L-R	Indicated engine anti-ice is operating uncommanded. Indicated engine bleed air is ON and A/I command is not active	1. Bleed / anti Ice synoptic - DISPLAY 2. Prior to landing recalculate landing performance ***On ground:*** 1. See MMEL
ENG Anti-ice Fail, L ENG Anti-ice Fail, R ENG Anti-ice Fail, L-R	Indicated engine anti-ice failed	**NOTE:** Moving the ENG A/I switches from AUTO to ON or ON to AUTO when the Ice Detected message is displayed may cause the ENG Anti-Ice Fail Caution message to display. 1. Affected system – OFF for a minimum of 3 seconds and then ON ***If failure persists:*** 2. Affected system – OFF 3. Do not fly into known or forecast icing conditions
ENG Fuel Filter, L-R	Both left and right engines detected an impending fuel filter bypass. Very high risk of fuel contamination	1. Monitor BOTH engines parameters and fuel synoptic 2. Land at nearest suitable airport

CAUTION MESSAGES (AMBER)

(Sheet 37 of 81)

Message	Triggered by	Corrective Action
ENG Fuel SOV Closed, L ENG Fuel SOV Closed, R ENG Fuel SOV CLSD, L-R	Indicated engine fuel shut off valve (SOV) is closed	1. Indicated Fire Handle position - AS REQUIRED
ENG Fuel SOV Fail, L ENG Fuel SOV Fail, R ENG Fuel SOV Fail, L-R	Indicated engine fuel shutoff valve failed or, valve data invalid	***In flight:*** 1. See SINGLE ENGINE FAILURE IN FLIGHT, Page II-55 ***On ground:*** 1. To shut down engine, pull on-side fire handle - DO NOT ROTATE
ENG Fuel TEMP Low, L-R	Fuel temperature dropped below acceptable value. Fuel freezing may occur	See ENG FUEL TEMP LOW (L-R), Page IIIA-250
ENG Oil PRESS High, L ENG Oil PRESS High, R ENG Oil PRESS HI, L-R	Indicated engine oil pressure above limit	1. Reduce thrust on affected engine to maintain oil pressure within limits. 2. Monitor engine parameters 3. Land as soon as practicable

CAUTION MESSAGES (AMBER)

(Sheet 38 of 81)

Message	Triggered by	Corrective Action
ENG Oil TEMP High, L ENG Oil TEMP High, R ENG Oil TEMP HIGH, L-R	Indicated engine oil temperature above limit	1. Reduce thrust on affected engine to maintain oil temperature within limits. 2. Monitor engine parameters 3. Land as soon as practicable
ENG Oil TEMP Low, L ENG Oil TEMP Low, R ENG Oil TEMP Low, L-R	Indicated engine: oil temperature less than 5°C (with thrust lever at Idle), or less than 15°C (when thrust lever at between idle and climb thrust)	CAUTION: IF OIL TEMPERATURE IS BELOW 5°C - DO NOT ADVANCE THROTTLE(S) ABOVE IDLE. IF OIL TEMPERATURE IS BELOW 15°C - THROTTLES MUST REMAIN BELOW CLIMB THRUST
ENG Oil Level Check, L ENG Oil Level Check, R ENG Oil Level CHK, L-R	Engine oil quantity low (message on ground only with engine not running)	Check engine oil quantity between five (5) and thirty (30) minutes after shutdown. (see AMM for servicing instructions). CAUTION: DO NOT SERVICE OIL WITH A COLD ENGINE

CAUTION MESSAGES (AMBER)

(Sheet 39 of 81)

Message	Triggered by	Corrective Action
Engine Exceedance, L Engine Exceedance, R Engine Exceedance, L-R	Engine exceeded thrust time limit: In TO above 4:45 minutes or, In APR/MPR above 9:45 minutes	1. Reduce thrust 2. Log for maintenance
Engine Vibration, L Engine Vibration, R Engine Vibration, L-R	Engine(s) vibration level is high	1. Affected engine thrust lever - RETARD UNTIL INDICATIONS RETURN TO NORMAL LEVEL See ENGINE VIBRATION, Page IIIA-256
Engine Fault, L Engine Fault, R Engine Fault, L-R	On ground only: engine control system functional failure	Do not dispatch
Engine Mach-Hold Fail	Mach hold function automatically disengaged due to: Failed ARINC input, or, Mach error exceeds 0.04 mach and engine reaches its authority limit of ±3% N_1 for 90 seconds	1. Press on Mach-Hold LSK in SMC THRST page twice. First to deselect the mode and second press to reselect it **NOTE:** If function cycled on SMC THRST page, and Mach hold is no longer available, expect Mach-hold Disengaged advisory CAS to come on.

CAUTION MESSAGES (AMBER)

(Sheet 40 of 81)

Message	Triggered by	Corrective Action
Engine Off (C), L Engine Off (C), R Engine Off (C), L-R	Engine shutdown by fire handle, or by FUEL CONTROL switch	Confirm FUEL CONTROL switch at desired position **NOTE:** Collector CAS message
External Baggage Door	On ground: external baggage door unlocked and one engine is running and acknowledge switch not activated. In flight: external baggage door unsafe	***On ground:*** 1. Secure door ***In flight:*** see EXTERNAL BAGGAGE DOOR UNSAFE, Page IIIA-245
FADEC Fail, L FADEC Fail, R FADEC Fail, L-R	Affected engine FADEC has failed	1. Monitor Engine parameters 2. Avoid rapid thrust lever movements
FCECU 1 Fail (C)	Flight Controls Electronic Control Unit (FCECU) 1 has failed	See FCECU 1 FAILURE, Page IIIA-142 **NOTE:** Collector message

CAUTION MESSAGES (AMBER)

(Sheet 41 of 81)

Message	Triggered by	Corrective Action
FCECU 1-2 Fail (C)	Left and Right Flight Controls Electronic Control Unit (FCECU) 1 and 2 primary channels have failed	1. See FCECU 1 FAILURE, Page IIIA-142 and FCECU 2 FAILURE, Page IIIA-144 2. Land at nearest suitable airport NOTE: Collector message
FCECU 2 Fail (C)	Flight Controls Electronic Control Unit (FCECU) 2 primary channel has failed	See FCECU 2 FAILURE, Page IIIA-144 NOTE: Collector message
FCECU Fail Safe Value	differences between the airspeed values is more than 40 kt	CAUTION: LIMIT FLIGHT ENVELOPE TO 250 KCAS / 0.70 M_I NOTE: Rudder, HSTA, Spoilers and Q-Feel systems will default to fail safe values **NOTE**: In case of erratic airspeed indications of two or three airspeed indicators, proceed to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218
FCECU Rig Switch On	Rigging switch is on	If rigging mode is not required turn RIG switch to OFF. (R AFT radio rack, on smoke EVAC panel)

CAUTION MESSAGES (AMBER)

(Sheet 42 of 81)

Message	Triggered by	Corrective Action
FD Drop AP Basic Mode	AFCS is unable to fly the active mode and changed to basic pitch and / or roll mode. Can be caused by AFCS reversion, discontinuity in flight plan, or last waypoint over flown	Select AP and AT modes as required **NOTE:** The message will self clear on ground after 4 seconds
Feed Fuel LVL Low, L Feed Fuel LVL Low, R	Fuel level in indicated feed tank is 280 lb or less	***If there is no evidence of fuel leak or abnormal fuel flow:*** 1. XFLOW valve - OPEN 2. Unaffected side STBY Pump - ON 3. Land at the nearest suitable airport **CAUTION:** AVOID EXCESSIVE NOSE HIGH OR NOSE LOW PITCH ATTITUDES
Fire BTL 1 Discharge Fire BTL 2 Discharge Fire BTL 1-2 DISCH	On ground only: Indicated fire bottle(s) discharged either intentionally or by rupture of the thermal relief fuse	Maintenance action is required. If fire bottle 2 is discharged, shut down APU unless required for emergency

CAUTION MESSAGES (AMBER)

(Sheet 43 of 81)

Message	Triggered by	Corrective Action
Fire Loop Fail, L Fire Loop Fail, R Fire Loop Fail, L-R	Indicated engine fire detection loop channel A and B have failed	Do not dispatch
Fire SYS CH A Fail	On ground only: Loss of FPS Channel A. No ARINC output	1. See MMEL **NOTE:** FIRE and OVERHEAT warning or caution CAS messages will not come on (fire handles and fuel cutoff switches will illuminate)
Fire SYS CH B Fail	On ground only: Loss of FPS Channel B. No Fire discrete available, No single loop B failure detection	1. See MMEL **NOTE:** FIRE and OVERHEAT warning or caution CAS messages will come on (fire handles and fuel cutoff switches will not illuminate)
Flaps Asymmetry	Flaps position asymmetry greater than 3° is detected	**CAUTION:** DO NOT ATTEMPT FURTHER MOVEMENT OF FLAPS. 1. Aileron trim - AS REQUIRED 2. See ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147

CAUTION MESSAGES (AMBER)

(Sheet 44 of 81)

Message	Triggered by	Corrective Action
Flaps Command Invalid	Flaps lever is not in a detent position for more than 5 seconds or flaps lever position sensors are invalid	1. FLAPS lever - VERIFY IN DETENT 2. FLAPS lever - Move to previous position, then reset to desired position ***If failure persists:*** 3. ALTN Flaps - ON ***If failure persists:*** 4. See ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147
Flaps Jam	Flaps are jammed	1. See FLAPS JAM, Page IIIA-146.
Flaps/STAB SYNC Fail	Flaps and stabilizer are out of synchronization	1. FLAPS lever - Move to previous position, then reset to desired position ***If failure persists:*** 2. Manually trim STAB to reduce pitch forces

CAUTION MESSAGES (AMBER)

(Sheet 45 of 81)

Message	Triggered by	Corrective Action
FQMC Channel Fail, L-R	Both fluid quantity measurement computer channels have failed	NOTE: The following are unavailable: • All fuel quantity, temperature and pressure CAS messages • Fuel temperature • Engine and APU oil level (on the ground) • Fuel synoptic • jettison auto Stop function • Total fuel and gross weight displays • Interconnect and XFLOW 1. Fuel Flow - CHECK ON EICAS OR FMS (ENGINE/FUEL page) 2. Monitor Fuel management and Flight Range. 3. Avoid fuel jettison 4. Land at nearest suitable airport
Fuel Imbalance	Fuel imbalance between wing tanks of more than 450 lb on ground or 900 lb in flight	See FUEL IMBALANCE, page IIIA-161

CAUTION MESSAGES (AMBER)

(Sheet 46 of 81)

Message	Triggered by	Corrective Action
Fuel INTER Valve Fail	Fuel interconnect valve is failed, not in commanded position or valve data invalid	See FUEL INTERCONNECT VALVE FAILURE, Page IIIA-163
Fuel JETT On, L Fuel JETT On, R Fuel JETT On, L-R	Fuel jettison commanded ON (indicated fuel standby pumps are operating)	1. Fuel Quantity - MONITOR **NOTE:** Fuel jettison stops automatically when fuel quantity reaches 800 lb on the respective side
Fuel Level Low, L Fuel Level Low, R Fuel Level Low	Fuel quantity in the respective side(s) is less than 580 lb	1. Fuel Quantity - MONITOR 2. Both STBY PUMPS - ON 3. Land at nearest suitable airport **CAUTION:** AVOID EXCESSIVE NOSE HIGH OR NOSE LOW PITCH ATTITUDES
Fuel Pressure Low, L Fuel Pressure Low, R Fuel Pressure Low, L-R	Indicated fuel pressure low with engine running when aircraft is below 25,250 ft	1. Do not climb above 25,000 ft 2. See FUEL PRESSURE LOW, Page II-49

CAUTION MESSAGES (AMBER)

(Sheet 47 of 81)

Message	Triggered by	Corrective Action
Fuel Pump Not Arm, L Fuel Pump Not Arm, R Fuel Pump Not Arm, L-R	Pre MOD G25-10074 Indicated fuel standby pump(s) not in ON or ARM position	1. Fuel STBY pump(s) OFF/ARM – ARM AS REQUIRED ***In air:*** If PUMP PWR or PUMP CTRL CB (H1, H11, I7, I17) has popped: 1. Reset CB only if required for safety of flight. 2. Select FUEL STBY PUMP to ON whenever required. 3. Continue flight. **NOTE**: If PUMP CTRL has popped - no Fuel STBY operation is possible. If PUMP PWR has popped - manual override and jettison will activate the STBY fuel pump.
Fuel Tank TEMP Low	Fuel tank temperature too low for the selected fuel type	See FUEL TANK TEMPERATURE LOW, Page IIIA-160
Fuel Transfer Fault	Fuel transfer sequence is interrupted from forward, center or aft fuel tank	See FUEL TRANSFER FAULT, Page IIIA-169

CAUTION MESSAGES (AMBER)

(Sheet 48 of 81)

Message	Triggered by	Corrective Action
Fuel XFLOW Valve Fail	Fuel cross flow valve is failed, not in commanded position or valve data invalid	***If fuel XFLOW valve remains open:*** 1. Fuel synoptic - DISPLAY 2. Fuel balance - MONITOR 3. Use FUEL INTERCONNECT as necessary to balance fuel required
Fuel XFLOW Valve Open	Fuel cross flow valve between the standby pumps is open for more than 5 minutes	1. Fuel Balance - MONITOR ***When fuel balancing is finished:*** 2. Fuel XFLOW valve - CLOSE
GCU Fail, L-R	Both GCUs failed	1. Electrical synoptic - MONITOR LOADS ***If indicated generators load is 0%:*** 2. Both GCU cb's (A13, A3) - VERIFY IN ***If failure persists and the generator load is low:*** 3. See L-R (DUAL) GENERATOR FAILURE (PRE MOD G25-20093), Page IIIA-124

CAUTION MESSAGES (AMBER)

(Sheet 49 of 81)

Message	Triggered by	Corrective Action
GCU Fail, L GCU Fail, R	Indicated GCU failed	1. Electrical synoptic - Display ***If indicated generator's load is 0%:*** 2. Indicated GCU cb's (A13, A3) - VERIFY IN ***If failure persists and generator load is low:*** 3. See SINGLE GENERATOR FAILURE, Page IIIA-133
Gear BTL PRESS Low	Emergency landing gear extension pneumatic bottle pressure is less than 2700 psi on ground	***On ground:*** Service emergency extension bottle ***If failure persists:*** Log for maintenance ***In flight:*** Continue flight
Gear Not Down	One or more of the landing gears are not down and locked with flaps position greater than 25°, or one of TLA less than 10° and radio altimeter less than 400 ft, or if invalid, then IAS less than 145 kt	1. Landing gear - EXTEND ***If failure persists:*** 2. See LANDING GEAR DOWNLOCK FAILURE / UNSAFE INDICATION, Page IIIA-207

CAUTION MESSAGES (AMBER)

(Sheet 50 of 81)

Message	Triggered by	Corrective Action
GEN Overload, L GEN Overload, R GEN Overload, L-R	Indicated generator(s) load exceed 100%	See GENERATOR OVERLOAD, Page IIIA-134
Generator Fail, L-R	Both generators have failed	See L-R (DUAL) GENERATOR FAILURE (PRE MOD G25-20093), Page IIIA-124
Generator Fail, L Generator Fail, R	Indicated generator failed	See SINGLE GENERATOR FAILURE, Page IIIA-133
GND Spoiler Auto Fail	Ground spoiler automatic deployment function has failed	***For Takeoff:*** See MMEL ***For Landing:*** Use manual SPEED BRAKE for landing. Apply 25% increase in actual landing distance.

CAUTION MESSAGES (AMBER)

(Sheet 51 of 81)

Message	Triggered by	Corrective Action
GPS 1-2 Fail	Both Global Positioning Satellite (GPS) navigation systems failed	1. GPS cb's (M17, M18) - RESET 2. Monitor GNSS CTRL page on CDU 3. Monitor RNP values on HSI ***If failure persists:*** 4. Advise ATC if unable to maintain required RNP
Ground Spoiler INHIB	Ground spoilers inhibit selected	1. GND SPLRS - AS REQUIRED
Ground Spoilers Fail	Ground spoilers deployment failure	Add 5% to landing distance
HYD Reservoir Hot, L HYD Reservoir Hot, R HYD Reservoir Hot, L-R	Indicated hydraulic reservoir(s) temperature above 95ºC	See HYDRAULIC RESERVOIR HOT / HYDRAULIC PRESSURE HIGH, Page IIIA-184
HYD Level High, L HYD Level High, R HYD Level High, L-R	Indicated bootstrap hydraulic level(s): L HYD level above 78% R HYD level above 58% (message on ground only)	Service hydraulic fluid before dispatch

CAUTION MESSAGES (AMBER)

(Sheet 52 of 81)

Message	Triggered by	Corrective Action
HYD Level Low, L HYD Level Low, R HYD Level Low, L-R	Hydraulic level(s) below 15%	***On ground:*** Service hydraulic fluid before dispatch ***In flight:*** 1. Hydraulic synoptic - MONITOR 2. Indicated HYD EMP - VERIFY OFF
HYD Pressure High, L HYD Pressure High, R HYD Pressure High, L-R	Indicated hydraulic pressure(s) above 3500 psi	See HYDRAULIC RESERVOIR HOT / HYDRAULIC PRESSURE HIGH, Page IIIA-184 /
HYD Pressure Low, L HYD Pressure Low, R HYD Pressure Low, L-R	Indicated hydraulic pressure(s) below 1300 psi and engine(s) are running	1. Hydraulic synoptic - MONITOR 2. Indicated HYD EMP - ON ***If failure persists:*** prepare for indicated hydraulic system failure
HYD QTY Refill, L HYD QTY Refill, R HYD QTY Refill, L-R	Indicated bootstrap hydraulic level(s): L HYD level below 47% R HYD level below 30% (message on ground only)	Service hydraulic fluid before dispatch

CAUTION MESSAGES (AMBER)

(Sheet 53 of 81)

Message	Triggered by	Corrective Action
HYD SYS Fail (C), L-R	Left and right hydraulic systems have failed	See LEFT AND RIGHT (DUAL) HYDRAULIC SYSTEMS FAILURE, Page IIIA-179 **NOTE:** Collector message
HYD System Fail (C), L	Left hydraulic system has failed	See LEFT HYDRAULIC SYSTEM FAILURE, Page IIIA-176 **NOTE:** Collector message
HYD System Fail (C), R	Right hydraulic system has failed	See RIGHT HYDRAULIC SYSTEM FAILURE, Page IIIA-173 **NOTE:** Collector message

CAUTION MESSAGES (AMBER)

(Sheet 54 of 81)

Message	Triggered by	Corrective Action
Ice Detected, L Ice Detected, R Ice Detected, L-R	Ice detected by probe. (Inhibited on ground), ENG and WAI command automatically ON if switches are in AUTO position and aircraft is above 1500 ft AGL (takeoff) or below 35,000 ft Post MOD G25-10074 Ice detected by probe and engine and wings are not protected	1. Check EICAS and Bleed/Anti-Ice Synoptic to verify Engine and Wing Anti-ice systems are operating. ***If the systems are ON (operating normally):*** 2. Keep switches in current position. ***If a system is not operating:*** 3. Inoperative Anti-ice system switch(s) – ON **NOTE**: Moving the ENG A/I switches from AUTO to ON or ON to AUTO when the Ice Detected message is displayed may cause the ENG Anti-Ice Fail Caution message to display.
Ice Detector Fail, L Ice Detector Fail, R Ice Detector Fail, L-R	Indicated ice detection system probe has failed	*See* ICE DETECTOR FAILURE, Page IIIA-192

CAUTION MESSAGES (AMBER)

(Sheet 55 of 81)

Message	Triggered by	Corrective Action
Ignition Fail, L Ignition Fail, R Ignition Fail, L-R	Indicated engine ignition failure	1. CONT IGN - ON 2. Avoid icing, turbulence, and/or heavy rain 3. Monitor engine parameters
INBD Brake ACCUM Low	Inboard system brake accumulator pressure is low (less than 1200 psi)	Hydraulic synoptic - MONITOR
INBD Brake Fail	Left and right inboard brake failed	See SINGLE CHANNEL BRAKE FAILURE, Page IIIA-200
INBD Brake Fail, L INBD Brake Fail, R	Indicated inboard brake control valve is has failed. (Indicated side outboard brake is still usable)	Continue use of both brake pedals. **NOTE:** Anticipate 15% increase in landing distance. Auto brakes mode unavailable
INBD Roll Assist Fail	Control wheel sensors of Inboard spoilers failed. Roll assist DISC pushbutton is not selected	Do not Dispatch
INBD Spoilers Fail	Inboard spoiler panels failure.	***On Ground***: Do not Dispatch ***In flight***: Log for maintenance. **NOTE:**:Speed brake effectiveness is reduced. There is no landing distance penalty.

CAUTION MESSAGES (AMBER)

(Sheet 56 of 81)

Message	Triggered by	Corrective Action
Internal Baggage Door	Internal baggage door is open above 39,500 ft or below 9,500 ft, or, Aircraft on ground and one engine is running and parking brake is off	**PRE MOD G25-10066:** Verify baggage compartment unoccupied and close the door **POST MOD G25-10066:** 1. If the aircraft is below 9,500 feet verify baggage compartment unoccupied and close the door 2. If aircraft is above 40,000 **a. If above 44,000 feet verify baggage compartment unoccupied and close the door** a. If at or below 44,000 feet minimize access to baggage compartment. Close the door when access completed.
IPC 1 Fail (C) IPC 2 Fail (C)	IPC 1 or 2 has failed on ground only	See IPC (INTEGRATED PROCESSING CABINET) 1 OR 2 OR BOTH FAILURES, Page IIIA-222
JETT AUTO Stop INOP	Jettison automatic stop is inoperative	See JETTISON AUTO STOP INOPERATIVE, Page IIIA-167

CAUTION MESSAGES (AMBER)

(Sheet 57 of 81)

Message	Triggered by	Corrective Action
JETT Valve Fail, L JETT Valve Fail, R JETT Valve Fail, L-R	Affected jettison valve failed or not in commanded position or invalid data	See JETTISON VALVE FAILURE, Page IIIA-165

CAUTION MESSAGES (AMBER)

(Sheet 58 of 81)

Message	Triggered by	Corrective Action
Lavatory Flush Open	Toilet Assembly Flush Valve fails to reach closed position within 6 seconds after flush activation.	1.Flush Pushbutton - PRESS **NOTE**: Repeat as necessary, up to 3 activations. **If message does not clear:** 2.Flush Valve - CLOSE MANUALLY **NOTE:** Access Flush Valve handle by removing trim panel in front of toilet assembly. Grasp each end of trim panel and pull sharply toward center aisle to release retaining clips. 3.Flush Valve Handle - ROTATE to actuate Flush Valve **If message does not clear:** ***In flight:*** 4.Cabin Pressurization - MONITOR **NOTE:** Descend as required to maintain cabin pressurization. If unable to descend and cabin pressure cannot be maintained, a cushion may be used to block the drain opening. ***On ground:*** 4.See MMEL, Section 2
Mach Trim Fail	Mach trim has failed	NOTE: Maximum mach number with mach trim inoperative is 0.77 M_i

CAUTION MESSAGES (AMBER)

(Sheet 59 of 81)

Message	Triggered by	Corrective Action
Main Bus Fail (C), L	Left main DC bus failed	See L MAIN BUS FAIL, Page IIIA-114 NOTE: Collector message
Main Bus Fail (C), L-R	Both Main bus failed.	See L-R (DUAL) MAIN BUS FAIL, Page IIIA-110 NOTE: Collector message
Main Bus Fail (C), R	Right main DC bus failed	See R MAIN BUS FAIL, Page IIIA-116 NOTE: Collector message
Main Entry Door	Door not closed/locked AND One engine or more is running AND PARK BRAKE is OFF AND Acknowledge switch not pressed	See MAIN ENTRY DOOR UNSAFE, Page IIIA-243

CAUTION MESSAGES (AMBER)

(Sheet 60 of 81)

Message	Triggered by	Corrective Action
Nose Temperature High	Nose avionics compartment temperature exceeds 140°F for more than the time limited operation (30 minutes)	***On Ground:*** 1. Select off (use cb's) unnecessary electronic / avionics equipment in nose compartment: WX, DU2, IPC 3, NAV 2,3, ADF, GPS2, DME 2. 2. See MMEL ***In flight:*** 1. Select off (use cb's) unnecessary electronic / avionics equipment in nose compartment: WX, DU2, IPC 3, NAV 2,3, ADF, GPS2, DME 2. 2. Land at nearest suitable airport NOTE: Following capabilities will also be lost depending on the cb's selected off: No NAV 2, 3, No CAT II capability; No GPS 2, No WAAS; No IPCs, No SVS, EGPWS and TAWS alerts.
NWS INOP	Nose wheel steering is inoperative (gear is down and locked)	1. NWS switch - CHECK / RESET ***If failure persists:*** 2. Use differential braking

CAUTION MESSAGES (AMBER)

(Sheet 61 of 81)

Message	Triggered by	Corrective Action
NWS Oversteer	Nose landing gear is over-steered during towing	Do not Dispatch
OTBD Roll Assist Fail	Control wheel sensors of outboard spoilers failed. Roll assist DISC pushbutton is not selected	Do not Dispatch
OTBD Spoilers Fail	Outboard spoiler panels failure.	***On Ground***: Do not Dispatch ***In flight***: Log for maintenance. **NOTE:** Speed brake effectiveness is reduced. There is no landing distance penalty.
OUTBD Brake ACCUM Low	Outboard brake system accumulator pressure is below 1200 psi	Hydraulic synoptic - MONITOR
OUTBD Brake Fail	Left and right outboard brake failed	See SINGLE CHANNEL BRAKE FAILURE, Page IIIA-200
OUTBD Brake Fail, L OUTBD Brake Fail, R	Indicated outboard brake control valve failed	Continue using both brake pedals **NOTE:** Anticipate 15% increase in landing distance. Auto brakes mode unavailable

CAUTION MESSAGES (AMBER)

(Sheet 62 of 81)

Message	Triggered by	Corrective Action
Outflow Valve Fail	Automatic control of outflow valve has failed	1. Bleed/anti-Ice synoptic - MONITOR OFV POSITION 2. CPCS mode pushbutton - MAN 3. CABIN ALT - CONTROL MANUALLY
OXY Masks PRESS Low	Oxygen pressure to crew or to Passenger Oxygen Controller (POC) is below 50 psi	1. Oxygen shutoff valve - CHECK ON 2. Oxygen pressure - CHECK SUMMARY /SECONDARY EICAS PAGE ***If failure persists*** 3. Descend to 14,000 ft or below
Oxygen Quantity Low	Oxygen bottle pressure is less than 800 psi	See Figure 2-1, Oxygen Duration; 123.4 CU FT, Page II-20, Oxygen Duration; 123.4 CU FT, page II-20
Pack Bleed Leak	Leak or rupture in the pack bleed air duct detected	1. CABIN TEMP control - MAN / MAX COLD ***If failure persists:*** 2. ALTN PRESS - ON NOTE: Pack closes automatically. See ALTERNATE PRESSURIZATION OPERATION, Page IIIA-91 ***If failure persists:*** 3. Land at nearest suitable airport

CAUTION MESSAGES (AMBER)

(Sheet 63 of 81)

Message	Triggered by	Corrective Action
Pack Bleed Loop Fail	Pack bleed air duct sensor has failed	1. Consider use of ALTERNATE PRESSURIZATION OPERATION, page IIIA-91 2. Land as soon as practicable
Pack Off	Pack valve is closed. May be displayed when ALTN BLEED selected, or PACK selected off, or during ATS engine start as long as ATS valve is open	1. PACK - AS REQUIRED
Parking Brake	Pressure in emergency lines is more than 200 psi and aircraft in flight	PARK BRAKE lever - STOW
Pilot Aileron DISC	Aileron disconnect handle is pulled	1. Aileron disconnect Handle - AS REQUIRED NOTE: Reduced roll authority - pilot can operate only roll spoilers, co-pilot can operate only ailerons
Pilot BRK PDL Fail	Pilot (left seat) brake controller has failed	Use copilot (right seat) brake pedals only. Auto brakes available
Pilot L BRK PDL Fail Pilot R BRK PDL Fail	Pilot (left seat) indicated brake pedal failure	Use copilot (right seat) brake pedals only. Auto brakes available

CAUTION MESSAGES (AMBER)

(Sheet 64 of 81)

Message	Triggered by	Corrective Action
Pilot STAB Trim Fail	Pilot stabilizer trim switch failed	Use copilot (right seat) trim switch. **NOTE:** Pilot trim switch may work if ALTN STAB selected, but autopilot will be unavailable
PRIM STAB Trim Fail	Primary stabilizer trim channel failed	**CAUTION:** AFTER NEXT ACTION AP WILL DISENGAGE. TAKE MANUAL CONTROL OF THE AIRCRAFT. 1. ALTN STAB - ON 2. Airspeed - BELOW 0.77M (MACH TRIM INOP) **NOTE:** Autopilot and flaps / stabilizer synchronization are unavailable. Stabilizer trim at reduced rate. 3. ATC - Advise 4. Land as soon as practicable
Primary Flaps Fail	Flaps have not achieved flaps lever commanded position for 30 seconds, or flaps lever not in valid detent position for more than 5 seconds, or, flaps are inoperative	1. FLAPS lever - Move to previous position, then reset to desired position ***If failure persists:*** 2. ALTN FLAPS - ON ***If failure persists:*** 3. See ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147

CAUTION MESSAGES (AMBER)

(Sheet 65 of 81)

Message	Triggered by	Corrective Action
Q-Feel Fail	Q-feel (artificial feel system) failure	See Q-FEEL FAILURE, Page IIIA-154
RIU 1 Fail RIU 2 Fail RIU 1-2 Fail	Indicated RIU failed. On-side CDU not inhibited	See RIU (RADIO INTERFACE UNIT) FAILURES, Page IIIA-96
RIU 1B Fail RIU 2B Fail	Indicated RIU channel failed and cross side tuning not inhibited	***On ground:*** Log for maintenance ***In flight:*** See RIU (RADIO INTERFACE UNIT) FAILURES, Page IIIA-96
Roll Assist DISC	ROLL ASSIST Disconnect Switch (RADS) has been selected or switch failed	1. ROLL ASSIST - AS REQUIRED
Roll Assist Fail	Control wheel sensors have failed and spoilers roll assist unavailable	NOTE: Roll rate is reduced. 2. Consider reducing landing weight 3. Select runway with minimum crosswind 4. Plan for a wide approach 5. Use flaps 20° for approach and landing 6. Approach speed - V_{REF}+20 KT NOTE: See V_{REF} For Abnormal Flaps Configurations, Page IIIA-148 for Flaps 20°

CAUTION MESSAGES (AMBER)

(Sheet 66 of 81)

Message	Triggered by	Corrective Action
RSE Heading Fail	Standby heading is failed after more than 2 minutes from power up.	***If ISI is failed (no attitude display):*** 1. See ISI (Integrated Standby Instrument) Failure, Page IIIA-216 ***If ISI is not failed:*** 2. FAST ERECT - PERFORM (SMC - MENU - FAST ERECT) ***If failure persist:*** 3. HSU CB (P14) - CYCLE ***If failure persist:*** 4. HSU CB (P14) - PULL 5. ISI HDG SOURCE - SELECT HDG1 or HDG2 or HDG3 (if IRS3 is installed) (SMC - MENU - HDG SRC).
RSE SSEC Disabled	Static Source Error Correction (SSEC) to the SMC is disabled	NOTE: STBY altimeter accuracy does not meet RVSM requirements

CAUTION MESSAGES (AMBER)

(Sheet 67 of 81)

Message	Triggered by	Corrective Action
RUD Fail Safe Value	ADC 1 & 2 airspeeds deviate more then 40 knots from the airspeed value arriving from the RSE (all 3 sources are valid)	NOTE: Rudder is limited to high speed gains above 250 KCAS or according to flaps position. Maximum crosswind for landing - 7 kt **NOTE**: In case of erratic airspeed indications of two or three airspeed indicators, proceed to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218
Rudder Fail	Rudder control is not operating	See RUDDER FAILURE, Page IIIA-149
Rudder Pedal CMD Fail	Rudder pedal sensors failure	See RUDDER PEDAL COMMAND FAILURE, Page IIIA-151
Side Window Fail, L Side Window Fail, R Side Window Fail, L-R	Side window controller or sensors failed or overheated	Check system's cb's: L side window - D1, D1 R side window - D11, D12
Single Rudder	One rudder control channel is unavailable	Do not dispatch

CAUTION MESSAGES (AMBER)

(Sheet 68 of 81)

Message	Triggered by	Corrective Action
SMC 1-2 Fail	Both Integrated Standby Multifunction Controllers (SMC) have failed	NOTE Loss of STBY ISI Most SMC actions can be performed by CCD 1. Land as soon as practicable
SMC 1 Overheat SMC 2 Overheat SMC 1-2 Overheat	Standby Multifunction Controller(s) (SMC) overheated	1. Pull the following cb's: SMC 1 - P2, P3 (DCP1, DSP1) SMC 2 - P12,P13 (DCP2, DSP2) NOTE: All SMC actions can be performed by CCD ***If both SMCs overheated:*** 2. Land as soon as practicable
SP/Shaker Fail	Stall protection system failed	See STALL PROTECTION SYSTEM FAILURE, Page IIIA-155
Speed Brakes Extended	Pre MOD G25-10074 Speed brakes are deployed with a throttle above idle (in flight only)	Retract speed brakes or reduce thrust as desired

CAUTION MESSAGES (AMBER)

(Sheet 69 of 81)

Message	Triggered by	Corrective Action
SSEC 1 Disabled	No. 1 Static Source Error Correction (SSEC) to Air Data System (ADS) has been disabled	**NOTE:** ADS 1 altitude accuracy does not meet RVSM requirement 1. ADS - REVERT TO ADS 2. (SMC - SNSR - ADS) 2. Verify Flight Director is coupled to valid system
SSEC 1-2 Disabled	Both Static Source Error Corrections (SSEC) to Air Data System (ADS) have been disabled	1. Check SSEC switch on right forward radio rack 2. Leave RVSM airspace
SSEC 2 Disabled	No. 2 Static Source Error Correction (SSEC) to Air Data System (ADS) has been disabled	**NOTE:** ADS 2 altitude accuracy does not meet RVSM requirement 1. ADS - REVERT TO ADS 1. (SMC - SNSR - ADS) 2. Verify Flight Director is coupled to valid system
Stabilizer Jam	Horizontal stabilizer jam is detected	See JAMMED HORIZONTAL STABILIZER, Page IIIA-140
Start Aborted, L Start Aborted, R Start Aborted, L-R	Indicated engine start sequences aborted	Reconfigure for a restart or secure the engine

CAUTION MESSAGES (AMBER)

(Sheet 70 of 81)

Message	Triggered by	Corrective Action
Starter Fail On, L Starter Fail On, R Starter Fail On, L-R	No starter cutout indicated on indicated engine (s)	See START VALVE FAILS TO CLOSE DURING ENGINE START, Page IIIA-252
Starter Fail, L Starter Fail, R Starter Fail, L-R	Indicated engine starter(s) failed	Maintenance action is required
STBY BATT Discharge	Standby battery is not being charged	1. STBY INT PWR cb (A1) - VERIFY IN 2. Consider landing within less than 60 minutes. For possible future failure - see STBY BUS FAILURE, Page IIIA-135 CAUTION: SMC HAS 60 MINUTES SUPPLY ON EMERGENCY POWER
STBY BATT Fail	Standby Battery failed	See STBY BUS FAILURE, Page IIIA-135
STBY Probe Heat Fail	STBY pitot tube failed	See PROBE HEAT FAILURE, Page IIIA-191

CAUTION MESSAGES (AMBER)

(Sheet 71 of 81)

Message	Triggered by	Corrective Action
STBY Pump INOP, L STBY Pump INOP, R STBY Pump INOP, L-R	Indicated STBY PUMP(S) is on and the pump(s) is not operating, or Indicated STBY PUMP(S) is ARM but not operating with low fuel pressure or FUEL JETTISON is on and the pump(s) not operating	See FUEL STANDBY PUMP INOPERATIVE, Page IIIA-157
STBY Pump On, L STBY Pump On, R STBY Pump On, L-R	Indicated fuel pressure drops and STBY FUEL PUMP(S) is armed or STBY FUEL PUMP(S) is off and FUEL JETTISON is on	See STANDBY PUMP ON, Page IIIA-158
Stick Pusher Fail	Stick pusher failed	See STALL PROTECTION SYSTEM FAILURE, Page IIIA-155 NOTE: Stick shakers are operative
Stick Pusher Off	STICK PUSHER OFF pushbutton selected	STICK PUSHER OFF - AS REQUIRED

CAUTION MESSAGES (AMBER)

(Sheet 72 of 81)

Message	Triggered by	Corrective Action
Stick Shaker Fail, L-R	Both control column shakers failed	**NOTE**: Stick pusher is operative
TAT Probe Heat Fail	Total Air Temperature (TAT) sensor heater failed	See PROBE HEAT FAILURE, page IIIA-191
TCAS Fail	TCAS system has failed. Pre-MOD G25-10074: The message will display until AHRS 1 is aligned on power up. Post MOD G25-10074: The message is masked on ground until AHRS is aligned and parking brake is released.	Notify ATC of TCAS failure **NOTE:** Message will display when PFD is in Unusual Attitude mode.
TDOWN PROTECT UNAVL	Touchdown protection unavailable	**CAUTION**: ENSURE NO BRAKE APPLICATION UNTIL AFTER POSITIVE TOUCHDOWN
Throttle CONFIG, L Throttle CONFIG, R Throttle CONFIG, L-R	Indicated thrust lever(s) not positioned at idle during engine start	Thrust lever(s) - IDLE

CAUTION MESSAGES (AMBER)

(Sheet 73 of 81)

Message	Triggered by	Corrective Action
Thrust REV Fail, L Thrust REV Fail, R Thrust REV Fail, L-R	Indicated thrust reverser not available	1. See MMEL 2. Do not use affected thrust reverser
Thrust REV Fault, L Thrust REV Fault, R Thrust REV Fault, L-R	Indicated thrust reverser not available due to internal fault	1. See MMEL 2. Do not use affected thrust reverser

CAUTION MESSAGES (AMBER)

(Sheet 74 of 81)

Message	Triggered by	Corrective Action
TO/GA Switch Stuck	System detected TO/GA switch stuck. **NOTE:** Pilot selection of the TO/GA is unavailable	***On ground:*** Log for Maintenance ***In air:*** 1. Select manually TO Thrust mode prior to final approach (SMC-THRST). *If missed approach is performed:* 2. Verify speed brakes retracted. When missed approach from ILS/LOC approach, after landing gear retract: 3. NAV source – SELECT ONSIDE FMS 4. Required lateral mode – SELECT. NOTE: 1) Speed brakes can be automatically retracted only when throttles will be advanced to above CLB detent. 2) TO thrust mode can be selected only manually in air. 3) During missed approach – no NAV to NAV transfer.

CAUTION MESSAGES (AMBER)

(Sheet 75 of 81)

Message	Triggered by	Corrective Action
TRs Stow Above 20 KTS	Indicated thrust reverser stowing operation depends on WST faulty signal	1. Reversers - STOW ABOVE 20 KT NOTE: Wheel speed signal drops at 20 kt and prevents reversers from stowing. ***If failed reverser(s) is stuck open:*** 2. Affected engine - SHUT DOWN
Ucommanded A/T Mode	Post MOD G25-10074 The throttle has been incorrectly commanded to RETARD mode	1. A/T – Disconnected 2. Thrust lever – As required NOTE: This CAS may appear momentarily if thrust levers are retarded abruptly above 50 feet RA.
Uncommanded Brake	Residual brake pressure in the system (parking brake is not set, pedals are not depressed)	See UNCOMMANDED BRAKING, Page IIIA-202

CAUTION MESSAGES (AMBER)

(Sheet 76 of 81)

Message	Triggered by	Corrective Action
Uncommanded Flaps	Uncommanded flaps motion is detected	CAUTION: DO NOT ATTEMPT FURTHER MOVEMENT OF FLAPS. 1. Maintain speed for flaps limits 2. See ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147
Uncommanded STAB Trim	Uncommanded stabilizer motion has been detected	See STABILIZER TRIM RUNAWAY, Page IIIA-152
Underspeed	Airspeed decelerated below normal operating regime. If deceleration continues, stall warning will occur.	1. Airspeed: Check. If airspeed lower than desired : 2. Throttles - Advance and accelerate to target speed. 3. Level wings if in turning flight.
VHF COM 1 Fail	VHF communications radio failed on ground	VHF 1 cb (L16) - CYCLE
VHF COM 1-2 Fail VHF COM 1-3 Fail	Indicated VHF communications radios failed on ground	Use available VHF radio for voice communications only

CAUTION MESSAGES (AMBER)

(Sheet 77 of 81)

Message	Triggered by	Corrective Action
VHF COM 1-2-3 Fail	All VHF communication radios failed on ground	1. Establish communications via HF / SATCOM 2. Follow no communications procedure
WAI Loop Fail, L WAI Loop Fail, R WAI Loop Fail, L-R	Indicated Wing Anti-Ice (WAI) bleed air duct sensor failure	***If wing anti ice is required:*** 1. Wing Anti Ice temperatures - MONITOR ***If wing anti ice is not required:*** 2. Indicated WING ANTI ICE - OFF 3. Avoid icing conditions
WAI System Fail	Both wings anti ice systems failed or WAI Crossover valve is in the wrong position	*See* L-R WAI SYSTEM FAIL, Page IIIA-186
WAI System Fail, L WAI System Fail, R	Indicated wing anti-ice system failed	*See* WING ANTI ICE OPERATION ON SINGLE SOURCE, Page IIIA-188
WAI XOVER Fail Close	The message indicates that the WAI Cross-Over valve has failed in the closed position.	*See* WAI XOVER Fail Close, Page IIIA-189

CAUTION MESSAGES (AMBER)

(Sheet 78 of 81)

Message	Triggered by	Corrective Action
WAI XOVER Fail Open	The message indicates that the WAI Cross-Over valve has failed in the Open position with 2 Bleeds and 2 WAI systems operating.	*See* WAI XOVER Fail Open, Page IIIA-190
Wheel Despin Fail	One or more wheels are spinning during or after landing gear retraction	1. Landing gear - DOWN 2. PARK BRAKE lever - PULL 500 PSI CAUTION: DO NOT EXCEED 195 KCAS WITH GEAR DOWN. 3. Landing gear - RETRACT
Windshield Fail, L Windshield Fail, R Windshield Fail, L-R	Indicated windshield heat failed or overheated	1. Affected WINDSHIELD HEAT - OFF then ON ***If failure persists:*** 2. Affected WINDSHIELD HEAT - OFF

CAUTION MESSAGES (AMBER)

(Sheet 79 of 81)

Message	Triggered by	Corrective Action
Wing Hot, L Wing Hot, R Wing Hot, L-R	Indicated wing anti-ice air distribution duct temperature is greater than 180°F	1. Both WAI - OFF 2. Bleed air / anti-ice synoptic - DISPLAY 3. Depart icing conditions CAUTION: 1. FOR ANY WING ANTI ICE FAILURE, IF ICING CONDITIONS WERE MET WHILE WINGS ARE COLD, USE V_{REF}. + 20 KT FOR APPROACH AND LANDING AND INCREASE LANDING DISTANCE BY 40%. 2. DO NOT EXCEED TIRE SPEED LIMITATIONS (182 KT GROUNDSPEED).

CAUTION MESSAGES (AMBER)

(Sheet 80 of 81)

Message	Triggered by	Corrective Action
Wing TEMP Low, L Wing TEMP Low, R Wing TEMP Low, L-R	Indicated wing anti-ice air distribution duct indicates under-temperature after 2 minutes of operation with L-R Wing AI ON	***On ground:*** 1. Engine thrust - INCREASE 2. Wing temperature - MONITOR ***If failure persists:*** 3. Both WAI - OFF 4. Refer to MMEL ***In air:*** 1. Engine thrust - INCREASE 2. Wing temperature - MONITOR *If wing temperatures indicate an increasing trend, continue to monitor temperatures. Ice will start to melt when wing temperatures are above 32°F/0°C. If wing temperature are not increasing:* 3. Both WAI - OFF 4. Depart icing condition CAUTION: 1. FOR ANY WING ANTI ICE FAILURE, IF ICING CONDITIONS WERE MET WHILE WINGS ARE COLD, ADD 40% TO LANDING DISTANCE AND 20 KT TO V_{REF}. 2. DO NOT EXCEED TIRE SPEED LIMITATIONS (182 KT GS).

CAUTION MESSAGES (AMBER)

(Sheet 81 of 81)

Message	Triggered by	Corrective Action
WOW Miscompare	Miscomparison between left and right Weight On Wheel (WOW) signals	See WOW MISCOMPARE, Page IIIA-203
Yaw Damper 1-2 Fail	Both yaw damper channels have failed	Flight envelope - Below 25,000 ft, 0.70 M_i / 250 KCAS See YAW DAMPER FAILURE, Page IIIA-94 **NOTE**: In case of erratic airspeed indications of two or three airspeed indicators, proceed to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218
Yaw Damper Off	Yaw damper is off	YD - ON

<<END>>

PFD (ADI AND HSI) CAUTION SYMBOLS AND FLAGS (AMBER)

ADI Caution Flags

(Sheet 1 of 5)

Symbol/Flag	Meaning	Initial Action/Reference
TA X.XXNM/ ±XX↑/↓	No bearing resolution advisory with traffic's (relative or absolute) altitude (in 100's ft) and altitude trend.	Be alert for potential conflicting traffic.
ADS1 **ADS2**	Air data system common source annunciation.	No action required.
AHS1 **AHS2**	AHS system common source annunciation.	No action required.
ALT	Indicated altitude Miscompare flag	Monitor altitude indications. Determine correct source by ISI vote. Verify reversion to correct ADS. Use ISI on failed side if required. If only one ALT indication is suspected as unreliable – See EQUIPMENT LOSS IN RVSM AIRSPACE, Page IIIA-229.
AOA	AOA data is failed.	Use ISI on failed side if required.
AT1 **AT2**	Respective autothrottle is disengaged.	Auto throttle – As required

PFD (ADI AND HSI) CAUTION SYMBOLS AND FLAGS (AMBER)

ADI Caution Flags

(Sheet 2 of 5)

Symbol/Flag	Meaning	Initial Action/Reference
ATT **ROL** **PIT**	Indicated attitude comparator flag. ROL is shown when roll data is out of limits. PIT is shown when pitch data is out of limits. ATT is shown when both pitch and roll data is out of limits.	Monitor attitude data. Determine correct source by ISI vote. Verify reversion to correct AHS. Use ISI on failed side if required.
CAT2	Category 2 approach comparator flag.	Below 600 ft RA – Go around. Above 600 ft RA – Continue to CAT1 minima.
DH	The set decision height differs between DU1 and DU3.	Check DH setting on each SMC-FLT REF
ENG	A miscompare condition exists between either N1, ITT, or N2.	Monitor engine parameters.
FD	Flight director miscompare flag during an ILS approach.	Monitor pilot and copilot flight director commands.

PFD (ADI AND HSI) CAUTION SYMBOLS AND FLAGS (AMBER)

ADI Caution Flags

(Sheet 3 of 5)

Symbol/Flag	Meaning	Initial Action/Reference
FD1 **FD2**	Non-coupled side is not yet independent, despite presence of glideslope annunciation. FD1 is shown on copilot side PFD. FD2 is shown on pilot side PFD.	Use appropriate minima for the approach with a single flight director.
FPV	Flight Path Vector miscompare flag.	Monitor pilot and copilot FPV information. Consider uncaging FPV if caged to see miscompare.
GND PROX	EGPWS terrain threat exist.	Initiate climb to avoid terrain warning.
GS	Glideslope miscompare flag.	Monitor pilot and copilot glideslope deviation information.
FMS	FMS lateral deviation flag during approach.	Monitor pilot and copilot lateral deviation information.

PFD (ADI AND HSI) CAUTION SYMBOLS AND FLAGS (AMBER)

ADI Caution Flags

(Sheet 4 of 5)

Symbol/Flag	Meaning	Initial Action/Reference
IAS	Indicated airspeed Miscompare flag	Monitor IAS indications. Determine correct source by ISI vote. Verify reversion to correct ADS. Use ISI on failed side if required. If only one IAS indication is suspected as unreliable – See EQUIPMENT LOSS IN RVSM AIRSPACE, Page IIIA-229. If both indications are unreliable - See UNRELIABLE AIRSPEED INDICATION, Page IIIA-218.
LOC	LOC lateral deviation flag during approach.	Monitor pilot and copilot Localizer deviation information.
MACH	MACH comparator flag.	Monitor pilot and copilot Mach data.
RA	Radar altimeter comparator flag. (Requires dual installation).	Monitor pilot and copilot radio altitude data. **NOTE:** Flag at bank angles greater than 20 degrees is expected
RA1 **RA2**	Radar altimeter common source annunciation.	No action required.

PFD (ADI AND HSI) CAUTION SYMBOLS AND FLAGS (AMBER)

ADI Caution Flags

(Sheet 5 of 5)

Symbol/Flag	Meaning	Initial Action/Reference
SYNC	AP SYNC button is pushed and the AP is unable to sync to current attitude.	No action required.
VSPD	Vspeed comparator flag. Vspeeds reference values shown on ADI may differ, or, removed from ADI.	Check pilot and copilot Vspeed data.
WINDSHEAR	Windshear threat exist.	Attention to nearby weather. The amber windshear icon indicates increasing performance

<<END>>

PFD (ADI AND HSI) CAUTION SYMBOLS AND FLAGS (AMBER)

HSI Caution Flags

Symbol/Flag	Meaning	Initial Action/Reference
Yellow circle with associated 2 or 3 digit number	Traffic advisory symbol at bearing/distance of traffic, with traffic's (relative or absolute) altitude and altitude trend.	Check for possible conflicting traffic at indicated bearing and altitude.
HDG	Heading miscompare flag.	Monitor pilot and copilot heading deviation information. Use ISI on failed side if required.
MAP	No flight plan is programmed.	Check FMS flight plan.
TCAS FAIL	TCAS system is failed.	TCAS warning not available.
TERRAIN FAIL	Terrain Awareness Warning System (TAWS) overlay display is failed.	Check GPS reception.
TURB FAIL		
WX FAIL	Weather radar overlay is selected and the weather radar is not reporting information.	No action required.
WX FAULT	Weather radar reporting itself as failed. Weather picture may be degraded.	No action required.

<<END>>

ATA 21 - AIR CONDITIONING SYSTEM

ALTERNATE PRESSURIZATION OPERATION

Pressing ALTN PRESS pushbutton closes the pack inlet valve and opens the alternate pressurization valve which directs airflow that bypasses the pack and enters the plenum.
ALTN PRESS Selected and Pack Off caution messages come on.

Options for alternate pressurization airflow sources:

- R ENG BLEED AIR
- L ENG BLEED AIR and Isolation Valve open
- APU BLEED AIR

1. Bleed/anti ice synoptic ..... DISPLAY
2. ECS synoptic ..... DISPLAY
3. Cabin and cockpit temperatures and cabin altitude ..... MONITOR

NOTE

Temperature is controlled directly by thrust lever position. There is no option to set a fixed temperature.

If Cabin Duct TEMP HI *or* Cockpit Duct TEMP HI *caution message comes on:*

4. Airspeed..... INCREASE (AT 40,000 FT AND HIGHER - 0.75 M_i MINIMUM)
5. COCKPIT/CABIN TEMP control ..... MAN

<<END>>

AUTOMATIC CABIN PRESSURIZATION FAILURE

CPCS Fail Select MAN *caution* message indicates that cabin pressure control system AUTO channel has failed.

1. CPCS MODE ..... MAN

NOTE

CPCS Manual Mode *caution* message will come on. Amber M will display adjacent to cabin altitude reading, and cabin altitude reading is amber.

2. CABIN ALT selector..... SET DESIRED CABIN ALTITUDE
   See Figure 4-1, Cabin Altitude Schedule, Page IV-33, CABIN ALTITUDE / PRESSURE SCHEDULE, Page IV-33

NOTE

During Climb:

Maintain Cabin altitude of Takeoff Field elevation until reaching 30,000 ft.
Above 30,000 ft - Set differential pressure to 9.0 - 9.2 psid.

During Cruise:

Set OFV position according to Figure 4-1. CABIN ALTITUDE / PRESSURE SCHEDULE, Page IV-33,
Above 30,000 ft - Verify differential pressure at 9.0 - 9.2 psid.

Descent:

When descending through 30,000 ft, set cabin altitude to Landing Field Elevation and maintain it until 2,000 ft AGL.
Descending through 2,000 ft AGL, open OFV fully

3. Cabin Altitude ..... MONITOR

<<END>>

ATA 22 - AUTO FLIGHT

AUTOPILOT FAILURE

Any of the following CAS messages indicate that the autopilot has failed:

Caution messages:

AP 1-2 Fail
AP 1-2 Fail - FCP
AP 1-2 Fail - AIL SRVO
AP 1-2 Fail - ELEV SRVO

NOTE

In case of AP 1-2 Fail - ELEV SRVO failure, Stick pusher is inoperative.

1. Aircraft.....FLY MANUALLY

If AP 1-2 Fail - AIL SRVO or AP 1-2 Fail - ELEV SRVO caution *message is displayed:*

2. AP AIL SERVO (O3) and
   AP ELEV SRVO (O4) cb's .....CHECK / CYCLE

If none of the above CAS messages is displayed:

3. Autopilot..... ATTEMPT TO RECONNECT

If autopilot fails to reconnect or fails again:

4. ATC.....ADVISE (UNABLE RVSM)

If AP SRVO OVRD Fail message comes on and autopilot is engaged - autopilot cannot be overridden by pilot force and can be disconnected only by AP quick disengage switch on yoke or AFCS DISCON bar.

<<END>>

YAW DAMPER FAILURE

Yaw Damper 1-2 Fail caution message indicates the loss of both yaw dampers. Dutch Roll may develop above 25,000 ft / 250 KCAS / 0.70 M_i.

Above 25,000 ft:

1. Speed Brakes.....DEPLOY PARTIALLY

NOTE

Deploying half Speed brakes has a positive effect on Dutch Roll damping.

2. Autopilot .....ENGAGE

NOTE

Engaging Auto Pilot in any lateral mode will dampen Dutch Roll significantly:

If Autopilot engaged successfully, Go to step 6.

If Autopilot cannot be engaged:

3. SMC - SENSOR ..... SELECT OTHER AFCS
4. Autopilot .....ENGAGE
5. Yaw damper .....ENGAGE

If Yaw damper cannot be engaged:

6. Check which DCU channel l (Pre MOD G25-10074: Advisory CAS message; Post MOD G25-10074: Caution CAS message) is failed and pull its CB's:
   If DCU 1 Channel A Fail is displayed..... Pull P6 and P8 CBs
   If DCU 1 Channel B Fail is displayed..... Pull P7 and P9 CBs
   If DCU 2 Channel A Fail is displayed.... Pull P16 and P18 CBs
   If DCU 2 Channel B Fail is displayed.... Pull P17 and P19 CBs
7. SMC - SENSOR ..... SELECT OTHER AFCS

NOTE

Sensor selection to another AFCS may not be possible in all cases.

(Continued)

8. Yaw damper ..... ENGAGE
9. Autopilot (if not engaged) ..... ENGAGE
10. Speed Brakes ..... AS REQUIRED
11. Reselect flight director lateral and vertical modes.

If failure persists:

12. Altitude ..... DESCEND BELOW 25,000 ft
13. Airspeed. ..... MAINTAIN BELOW 250 KCAS / 0.70 M_i
14. Landing ..... PERFORM NORMAL LANDING

<<END>>

Yaw Damper 1 Fail or Yaw Damper 2 Fail advisory messages indicates failure of the indicated autopilot yaw damper channel. The AFCS system reverts to cross-side yaw damper. No corrective action is required.

If a single yaw damper failure is active and AFCS did not revert:

1. SMC - SENSOR ..... SELECT OTHER AFCS

NOTE

FD Drop AP Basic Mode caution message may come on. Reselect flight director modes.

2. Yaw damper ..... ON

<<END>>

ATA 23 - COMMUNICATION

RIU (RADIO INTERFACE UNIT) FAILURES

If any of the following messages is displayed, it indicates Radio Interface Unit (RIU) failure:

RIU 1 Fail *caution message indicates RIU 1 failed*

Loss of primary and secondary tuning of VHF1 and NAV 1. Datalink 1 is unavailable.

1. Inhibit left CDU and right CDU from tuning; CDU Tune Inhib, L-R status message comes on
2. Use DU TUNE page and C CDU
3. Use datalink 2

RIU 1A Fail *advisory message indicates RIU 1A channel failed*

Loss of secondary left radios tuning. loss one channel of aural alert and #1 data link system.

1. No corrective action

RIU 1B Fail *caution message indicates RIU 1B failed*

Loss of primary left CDU radios tuning.

1. Inhibit L CDU and use R CDU to tune the #1 Radios. CDU Tune Inhib, L status message comes on

RIU 2 Fail *caution message indicates RIU 2 failed*

Loss of primary and secondary right CDU tuning of right radios.

1. Inhibit left CDU and right CDU from tuning the #2 radios; CDU Tune Inhib, L-R status message comes on

Loss of primary and secondary Right CDU tuning of right radios.

2. Use DU tune page and C CDU to tune the #2 Radios

(Continued)

RIU 2A Fail *advisory message indicates RIU 2A failed*

Loss of data link #2.

1. No corrective action.

RIU 2B Fail *caution message indicates RIU 2B failed*

Loss of primary right CDU radios tuning.

1. Inhibit R CDU and use L CDU to tune the #2 radios. CDU Tune Inhib, R status message comes on

RIU 1-2 Fail *caution message indicates RIU 1 and RIU 2 failed.*

Loss of primary and secondary left and right CDU tuning of radios.

1. Inhibit left CDU and right CDU. CDU Tune Inhib, L-R status message comes on
2. Use DU tune page and C CDU to tune the #1 radios

<<END>>

TUNING INOPERATIVE MESSAGE ON CDU TUNE PAGE AND/OR DU TUNE WINDOW

Loss of a CDU or failures within the RTSA may result in loss of tuning capability through the CDU and DU.

If LEFT-SIDE TUNING INOPERATIVE *message is displayed on the CDU tune page and DU tune window:*

Inhibit left CDU tuning:

1. On SMC select UTIL, tune REV, left CDU inhibit

or

1. On HSI menu select tune REV, left CDU Inhibit

NOTE

CDU Tune Inhib, L status message comes on and normal tuning is restored.

If RIGHT-SIDE TUNING INOPERATIVE *message is displayed on the CDU tune page and DU tune window:*

Inhibit Right CDU Tuning:

1. On SMC select UTIL, tune REV, right CDU inhibit

or

1. On HSI menu select tune REV, right CDU inhibit

NOTE

CDU Tune Inhib, R status message comes on and normal tuning is restored.

(Continued)

If LEFT-SIDE TUNING INOPERATIVE *and* RIGHT SIDE TUNING INOPERATIVE *messages are displayed on the CDU tune page and* DU TUNING INOPERATIVE *is displayed in the DU tune window:*

Inhibit both left and right CDU tuning:

1. On SMC select UTIL, tune REV, Left CDU inhibit & right CDU inhibit

or

2. On HSI menu select tune REV, left CDU inhibit & right CDU inhibit

NOTE: L-R CDU Tune Inhibit CAS shall come on and normal tuning is restored.

NOTE

CDU Tune Inhib, L-R status message comes on and normal tuning is restored.

<<END>>

INABILITY TO TUNE COM/NAV RADIOS OR UNEXPECTED TUNING BEHAVIOUR

Failures within the RTSA may result in the COM/NAV radios not responding to inputs through the CDU or DU. Unexpected tuning behavior may include uncommanded toggling between frequencies, an amber frequency display when a valid frequency is entered or the RTSA not accepting the input of a valid frequency.

If a CDU has failed or LEFT-SIDE TUNING INOPERATIVE *and/or* RIGHT-SIDE TUNING INOPERATIVE *message is displayed on the CDU tune page and DU tune window, perform CDU failure or* TUNING INOPERATIVE MESSAGE ON CDU TUNE PAGE AND/OR DU TUNE WINDOW, Page IIIA-98*.*

Attempt to restore normal operations by inhibiting DU and CDU tuning individually, one at time, in the following order: DUs, center CDU (if installed), Right CDU, Left CDU.

To inhibit DU tuning:

1. On SMC select UTIL, tune REV, all DUs inhibit

or

2. On HSI menu select tune REV, all DUs inhibit

NOTE

DU Tune Inhibited status message comes on.

If normal operations are not restored, un-inhibit the DU tuning and inhibit each CDU individually, one at a time.

(Continued)

To inhibit CDU tuning:

1. On SMC select UTIL, tune REV, C or R or L CDU inhibit

or

2. On HSI menu select tune REV, C or R or L CDU inhibit

NOTE

CDU Tune Inhib, L, CDU Tune Inhib, C *or* CDU Tune Inhib, R status messages come on with each corresponding inhibit selection.

3. If normal operations are not restored by inhibiting the DUs or CDUs individually, attempt various combinations of inhibiting the DUs and CDUs simultaneously to restore normal operation

NOTE

Inhibiting the left or right CDU may render all left or right COM/NAV radios inoperative, respectively. Determine if losing all left or right radios is more desirable than the original problem before leaving the respective CDUs inhibited.

<<END>>

ATA 24 - ELECTRICAL POWER

L EMERGENCY BUS FAIL

EMER Bus Fail (C), L caution message indicates that left emergency bus voltage is below 19V for 7 seconds or below 5V for 1 second.

NOTE

The message is a collector CAS message.

The following messages come on

Caution messages:

L EMER Bus Fail (C)	> Aileron Trim Fail
Stick Pusher Fail	> FCECU 1 Fail
APU Fail	> OUTBD Brake Fail
L ENG A/I Fail On	> L BAS Fail
> PRIM STAB Trim Fail	> ACS Fail
> Flaps/STAB Trim Fail	> Ground Spoilers Fail
Yaw Damper 1-2 Fail	> OUTBD Spoilers Fail
> Bleed Leak CH B Fail	STBY Probe Heat Fail

Advisory messages:

APU Maintenance REQD	ACP 1 Fail
APU Door Failed Close	L-R ENG Thrust Fault
ATC/TCAS STBY	L CCD Fail
DU Cross Talk Fail	AP SRVO OVRD Fail
Rudder TCM Fail	

(Continued)

NOTE

Thrust Reversers are not available for landing.

CAUTION

EXPECT SIGNIFICANT PITCH FORCES WITH AUTOPILOT DISENGAGEMENT. HOLD YOKE FIRMLY AT DISCONNECTION.

1. Autopilot ..... DISENGAGE
2. ALTN STAB ..... ON

NOTE

Slower STAB trim rate at low speed. Trim bar changes to amber indicating that ALTN STAB is selected.

3. Airspeed/Altitude ..... MAINTAIN BELOW 250 KCAS / 0.70 M_i / 25,000 FT
4. R ENG BLEED ..... VERIFY ON
5. ALTN BLEED ..... ON
6. Cabin TEMP (cockpit TEMP INOP) ..... MAN
7. Electrical synoptic ..... MONITOR

(Continued)

If failure persists:

8. Leave RVSM airspace
9. Avoid Icing conditions
10. Land at nearest suitable airport
11. Landing Performance ..... CALCULATE

NOTE

1. Landing distance is increased due to loss of ground and outboard spoilers. Add 5% to landing distance.
2. Only INBD brakes are available with anti skid protection. Anticipate 66% increase in landing distance.

12. Landing gear ..... IF POSSIBLE
    HAVE TOWER CONFIRM GEAR POSITION.

NOTE

Only right and nose landing gear position indications available.

After touch down and aircraft nose lowered:

13. Wheel brakes ..... AS REQUIRED

(Continued)

SYSTEMS affected by the failure:

Brakes	-	Outboard brakes failure. No Autobrake.
Landing Gear indications	-	Left LG - amber. White light in LG lever
Bleed Air / Anti Ice	-	L WAI is inoperative
	-	Inability to shut off PACK Valve
	-	ACS system failure
	-	L ENG A/I failed on
ECS	-	DEFOG remains in last position
Electrical	-	APU unavailable
Fuel	-	L jettison inoperative
	-	L STBY Pump inoperative
Fire System Failures	-	Bleed Loops - L ENG, L WAI
	-	No cyan and amber CAS messages (CH B)
Hydraulic System	-	No ability to close Left HYD FIRE SOV
	-	No left HYD pressure indications
COMM	-	ACP 1, RIU1B FAIL
NAV	-	NAV 1, ADF 1, FMS 1, CCD 1
ADC 1 Fail	-	Auto reversion to ADC 2
CVR and FDR	-	RECORDER 1 failed
Displays	-	DU2 reverts to ADI and HSI

<<END>>

R EMERGENCY BUS FAIL

EMER Bus Fail (C), R caution message indicates that right emergency bus voltage is below 19V for more than 7 seconds, or less than 5V for more than 1 second.

NOTE

The message is a collector CAS message.

The following messages come on

Caution messages:

R EMER Bus Fail (C)
L-R ENG Oil Level CHK
> Q Feel Fail
R ENG A/I Fail On
> PRIM Flaps Fail
> Flaps/STAB Trim Fail
FCECU 2 Fail
> Bleed Leak CH A Fail
> INBD Brake Fail
> R BAS Fail
BTL 2 ENG Squibs Fail
Autobrakes Fail
STBY Probe Heat Fail

Advisory messages:

> INBD Spoilers Fail
Windshear Fail
Ground PROX Fail
R BAS Default Mode
VHF COM 1 Fail
TCM Fail
ACP 2 Fail
L-R ENG Thrust Fault
Exceedance Record
FPS Maintenance REQD

(Continued)

The following systems are inoperative:

- Nose wheel steering
- Fire loops: R ENG, PACK, R WAI, APU, fire bottle 2
- Left and right thrust reversers
- Inboard brakes
- APU start
- If FCECU 2 has failed FCECU 2 Fail (C) caution message comes on
    - Flaps - normal and alternate
    - Inboard spoilers
    - Alternate STAB trim
    - Q-Feel (anticipate lighter elevator control forces above 200 kt)

If after takeoff with flaps extended:

1. Flaps .....Leave in last position (no flaps indications)
2. Airspeed..... Maintain below flap speed limitation
3. Continue to step 6

If flaps are retracted:

4. FLAPS.....DO NOT EXTEND
5. Airspeed/Altitude..... MAINTAIN BELOW 250 KCAS / 0.70 M_i / 25,000 FT
6. Avoid icing conditions
7. Proceed to nearest suitable airport
8. L ENG BLEED. .....VERIFY ON
9. Cockpit TEMP selector (cabin TEMP INOP)..... MAN
10. Inhibit L CDU tuning .....SMC - UTIL- TUNE REV
11. Electrical synoptic ..... MONITOR

(Continued)

If failure persists:

12. Leave RVSM airspace
13. Landing performance ..... CALCULATE

Flaps position	Performance figures: Landing Weight Limitation / V_{REF} / Actual Landing Distance
0°	Figure 5-297
10°	Figure 5-293
20°	Figure 5-289

NOTE

Only OUTBD brakes are available with anti skid protection. Anticipate 66% increase in landing distance.

If landing configuration is Flap 0°, reduce to minimum landing weight.

14. TAWS/FLAP OVRD.....ON

NOTE

Selecting TAWS/FLAPS OVRD to ON prevents nuisance “TOO LOW FLAPS” aural alert.

15. VOICE OVRD.....ON

NOTE

Select VOICE OVRD to ON prevents nuisance “TOO LOW GEAR” aural alert.

16. Landing Gear .....If possible have tower confirm gear position

NOTE

Only left landing gear position is available. Indication for nose landing gear down-lock is an operative taxi light.

(Continued)

17. V_{REF} ..... SET FOR FLAP CONFIGURATION

NOTE

See V_{REF} For Abnormal Flaps Configurations, Page IIIA-148.

After touch down and aircraft nose lowered:

18. Wheel brakes ..... Apply
19. Directional control ..... Use rudder and differential braking

The following systems are inoperative:

Brakes	-	Inboard brakes failure. No autobrake.
Landing Gear indications	-	Right and Nose LG - amber
Nose Wheel Steering	-	Inoperative (No CAS display)
Bleed Air / Anti Ice	-	Isolation valve closed
	-	R WAI is inoperative
	-	R ENG Anti Ice failed on.
ECS	-	Manual cabin pressure control disabled
	-	Baggage Isolation Valve fails in last position.
Fuel	-	R jettison inoperative
	-	R STBY pump inoperative
	-	XFLOW valve fails in last position
Fire System Failures	-	Bleed loops - PACK, APU, R ENG, R WAI
	-	Smoke Detectors - Baggage, Lavatory
	-	No red light in fire handles
Hydraulic System	-	No ability to close R HYD SOV
	-	No right HYD pressure indications
COMM	-	VHF 1, ACP 2, ATC 2, CDU 1, PA
NAV	-	GPS 1
AoA	-	R AOA invalid

L-R (DUAL) MAIN BUS FAIL

Main Bus Fail (C), L-R caution message indicates that both main buses voltage is less than 19V for more than 5 seconds, or less than 5V for more than 1 second.
Total loss of electrical power supply, except for SMC's (STBY BUS) and emergency buses.

NOTE

1. This message is a collector CAS message.
2. Numerous messages come on as result of the loss of generated power including DISTR Bus Fail (C), L-R, STBY BATT Discharge and Battery Discharge, L-R.

The following messages come on

Caution messages:

> STBY Probe Heat Fail
> CPCS Fail Select MAN (C)
> Q-Feel Fail
> Stick Pusher Off
> A/T 1-2 Fail – TQA
> A/T 1-2 Fail
> AP 1-2 Fail
> ADS 1-2 Probe HT FL
> Mach Trim Fail
> Yaw Damper 1-2 Fail
> TAT Probe Heat Fail

Advisory messages:

> Windshear Fail
> Ground PROX Fail
> R AOA Heat Fail
> Rudder TCM Fail

(Continued)

Possible reason for Failure

- One generator failure AND a short circuit on the cross side main bus
- Short circuits on each main bus

1. Take manual control of the aircraft.
2. Airspeed / Altitude ..... MAINTAIN BELOW 250 KCAS / 0.70 M_i / 25,000 FT

CAUTION

IF DUTCH ROLL DEVELOPS, COUNTERACT USING YOKE. IF REQUIRED EXTEND HALF SPEED BRAKES.

NOTE

Above 200 KCAS, anticipate lighter than normal elevator control forces due to loss of Q-Feel.

3. CPCS MODE ..... MAN
4. Exit / avoid icing conditions
5. Both MAIN TIE CB's (A12 and A2)..... PULL
6. Both GEN..... OFF
7. ELECTRICAL RESET ..... PRESS
8. Both GEN..... ON

If power is restored to both main buses - leave main bus tie CBs pulled and land at nearest suitable airport.

If power is restored to only one bus - proceed to the indicated bus failure procedure. See L MAIN BUS FAIL, Page IIIA-114, *or* R MAIN BUS FAIL, Page IIIA-116

If failure persists on both buses:

9. Electrical Synoptic..... MONITOR ELECTRICAL LOADS

(Continued)

10. Both MAIN TIE CB's (A12 and A2).....RESET

CAUTION

ONLY TWO APU START ATTEMPTS ARE POSSIBLE ON BATT POWER. APU CANNOT BE STARTED IF EMER BUS WAS SELECTED TO BATT ON.

11. Start APU below 35,000 ft
12. APU MASTER.....ON
13. APU START .....PRESS
14. APU GEN..... ON; MONITOR LOADS

NOTE

APU operation limited to 40,000 ft.

If APU GEN available and powers aircraft - Continue to L-R (DUAL) DISTRIBUTION BUS FAILURE, Page IIIA-118

15. Inhibit R AND C CDU from tuning .....SMC-UTIL-TUNE REV
16. Pull the following circuit breakers for load shedding:

NOTE

Step a and b will turn off R SMC and inhibit SMC menu operation.

a. DSP 2 (P12)
b. DCP 2 (P13)
c. DU 1.....Switch off for 20 minutes; consider switching on for approach and landing.

17. ATC 2 .....SELECT; SET 7700 L CDU - TUNE - ATC
18. EMER BUS .....BATT ON

NOTE

Emergency BATT On caution message comes on.

19. Land at nearest suitable airport
20. Perform normal landing

If EMER BATT is selected - the following systems are inoperative:

Flight Controls	-	Q Feel, Rudder Pedal Feedback, AP 1-2, AT TQA, YD 1-2
	-	R Stick shaker, Stick Pusher
ECS	-	AUTO Cabin PRESS CTRL and ALTN PRESS
	-	Equipment cooling (AFT R/R, R Nose, DU's)
	-	Cabin and Cockpit MAN TEMP CTRL
	-	L-R W/S and S/W Heat
	-	L-R Ice Detectors
Instruments	-	ADC 2
Navigation	-	FMS 2, NAV 2-3, DME 1-2, GPS 2
Displays	-	DU 2-3, CDU 2-3, CCD 2
Communication	-	VHF 2-3, HF 1-2, SATCOM, ACP 3, ATC 1
Alerts	-	TCAS, RADALT TAWS 1-2, (Windshear, Terrain)

<<END>>

L MAIN BUS FAIL

Main Bus Fail (C), L caution message indicates that left main bus voltage is below 19V for more than 5 seconds, or less than 5V for more than 1 second.

NOTE

The message is a collector CAS message.

The following messages come on

Caution messages:

> STBY Probe Heat Fail
> Yaw Damper 1-2 Fail
> CPCS Fail Select MAN
> Stick Pusher Off
> A/T 1-2 Fail – TQA
> A/T 1-2 Fail
> AP 1-2 Fail
> Mach Trim Fail
> TAT Probe Heat Fail
> ADS 1 Probe HT FL

Advisory messages:

> L AOA Heat Fail
> Windshear Fail
> Ground PROX Fail
> Rudder TCM Fail

(Continued)

1. Take manual control of aircraft.
2. If yaw Damper is failed - revert to other AFCS cabinet (SMC-SENSOR)
3. Electrical synoptic ..... Monitor electrical loads
4. L BATT ..... VERIFY ON
5. Avoid icing conditions.
6. ATC ..... SELECT ATC 2 (CDU -TUNE - ATC)
7. Land as soon as practicable

Systems affected by the failure:

Electrical	-	Distribution, 60HZ Inverter
Flight Controls	-	TCM or Rudder Trim
No Stick Shaker/Pusher	-	Maintain speed margins.
Autopilot	-	Inoperative
AT TQA	-	Manual Throttle control
Hydraulics	-	L EMP Inoperative
ECS	-	L Ice Detector
	-	Equipment cooling (L Nose, DU, FWD R/R)
	-	Cockpit MAN TEMP CTRL
	-	L W/S and S/W Heat
ADC 1 Fail	-	Automatic reversion to ADC 2 should occur
Communication	-	HF1, VHF 3, SATCOM (Opt)
NAV	-	FMS 3 (Opt), NAV 3 (Opt)
Display	-	DU 2 fails
WX	-	Failed
Alerts and Annunciations	-	TCAS, TAWS, Windshear, RAD ALT

<<END>>

R MAIN BUS FAIL

Main Bus Fail (C), R caution message indicates that right main bus voltage is less than 19V for more than 5 seconds, or less than 5V for more than 1 second.

NOTE

The message is a collector CAS message.

The following messages come on

Caution messages:

> Yaw Damper 1-2 Fail
> Q Feel Fail
> Stick Pusher Fail
> Mach Trim Fail
> CPCS Fail Select MAN
> ADS 1 Probe HT FL

Advisory messages:

> Rudder TCM Fail
> L AOA Heat Fail

1. Electrical Synoptic.....MONITOR ELECTRICAL LOADS
2. If yaw damper is failed .....revert to other AFCS cabinet (SMC-SENSOR)

3. R BATT.....VERIFY ON
4. CPCS MODE .....MAN
5. Airspeed / Altitude .....MAINTAIN BELOW 250 KCAS / 0.70 M_i

NOTE

Above 200 KCAS, anticipate lighter than normal elevator control forces.

(Continued)

6. Avoid Icing conditions.
7. Inhibit R CDU Tuning ..... SMC - UTIL - TUNE REV
8. Land as soon as practicable.

SYSTEM affected by the failure:

Electrical	-	R Distribution, Cabin, Galley
Flight controls	-	Q Feel and R Stick Shaker
Fuel	-	R STBY fuel pump INOP - XFLOW valve for balancing and jettisoning if needed
Hydraulic	-	R EMP fails
Anti icing	-	R Main windshield and R side window
ECS	-	AUTO Cabin PRESS CTRL and ALTN PRESS
	-	Equipment cooling (AFT R/R, R Nose, DU's)
	-	Cabin MAN TEMP CTRL
	-	R Ice Detector
ADC 2 Fail	-	Automatic reversion to ADC 1 should occur.
COMM	-	VHF 2, HF 2, ACP 3(Opt)
NAV	-	GPS 2, FMS 2, NAV 2, DME 2, ADF 2(Opt)
CVR and FDR	-	RECORDER 2
Displays	-	DU 3 fails
IPC 2	-	FMS2 / MAP2 / GFP2 Fail, IFIS2 Fail (Opt)
Alerts and Annunciations	-	TCAS 2, TAWS 2(Opt), Windshear 2 (Opt), RAD ALT (Opt)

<<END>>

L-R (DUAL) DISTRIBUTION BUS FAILURE

DISTR Bus Fail (C), L-R caution message indicates that both left and right distribution bus voltage is less than 19V for more than 5 seconds, or less than 5V for more than 1 second.

If Generator Fail, L-R *caution message is on:*

1. Perform L-R (DUAL) GENERATOR FAILURE (PRE MOD G25-20093), page IIIA-124 or L-R (DUAL) GENERATOR FAILURE (POST MOD G25-20093), Page IIIA-128

NOTE

This message is a collector CAS message.

The following messages come on

Caution messages:

L-R DISTR Bus FL (C)
> CPCS Fail Select MAN (C)
> Q-Feel Fail
> Stick Pusher Fail
> A/T 1-2 Fail
> AP 1-2 Fail
> ADS 1-2 Probe HT FL
> Mach Trim Fail
> Yaw Damper 1-2 Fail
> TAT Probe Heat Fail

Advisory messages:

> Windshear Fail
> Ground PROX Fail
> RUD PDL Feedback Fail

(Continued)

1. Take manual control of aircraft
2. Airspeed / Altitude ..... MAINTAIN BELOW 250 KCAS / 0.70 M_i / 25,000 FT

CAUTION

IF DUTCH ROLL DEVELOPS - COUNTERACT USING YOKE. IF REQUIRED EXTEND HALF SPEED BRAKES.

NOTE

Above 200 KCAS, anticipate lighter than normal elevator control forces due to loss of Q-Feel.

3. Electrical synopticMonitor electrical loads
4. Both batteries ..... VERIFY ON
5. CPCS MODE ..... MAN
6. Exit Icing conditions
7. Land at nearest suitable airport

Systems affected by the failure:

Flight Controls	-	Q Feel, Rudder Pedal Feedback, AP 1-2, AT 1-2, YD 1-2,
	-	R Stick shaker, Stick Pusher
ECS	-	AUTO PRESS CTRL and ALTN PRESS
	-	Cabin and Cockpit MAN TEMP CTRL
Anti-Ice	-	L-R W/S + S/W heat
	-	L-R Ice detectors
Instruments	-	ADC 2, AHRS 2
NAV	-	FMS 2-3, NAV 2-3, DME 1-2, GPS 2
Displays	-	DU 2-3, CDU 2-3
COM	-	VHF 2-3, HF 1-2, SATCOM, ACP 3 ATC1 / TCAS
Alerts	-	TCAS1-2, RADALT 1-2, TAWS 1-2, (windshear, terrain), ELT

<<END>>

L DISTRIBUTION BUS FAIL

DISTR Bus Fail (C), L caution message indicates that left distribution bus voltage is less than 19V for more than 5 seconds, or less than 5V for more than 1 second.

NOTE

This message is a collector CAS message.

The following messages come on

Caution messages:

L DISTR Bus Fail (C)
> Yaw Damper Off
> CPCS Fail Select MAN
> Stick Pusher Fail
> A/T 1-2 Fail
> AP 1-2 Fail
> Mach Trim Fail
> TAT Probe Heat Fail
> ADS 1 Probe HT FL

Advisory messages:

> Windshear Fail
> Ground PROX Fail

(Continued)

1. Take manual control of aircraft
2. If yaw damper is failed ..... Revert to other AFCS cabinet (SMC-SENSOR)
3. Electrical Synoptic..... Monitor electrical loads
4. L BATT .....VERIFY ON
5. Avoid Icing conditions
6. ATC ..... SELECT ATC 2 (CDU -TUNE - ATC)
7. Land as soon as practicable.

Systems affected by the failure:

Flight Controls	-	Rudder Pedal Feedback, AP 1-2, AT TQA, YD 2, Stick Pusher
ECS	-	Equipment cooling (L Nose, DU, FWD R/R)
	-	Cockpit MAN TEMP CTRL
Anti Ice	-	L Ice Detector, TAT Heat, L WS Heat, Side window Heat
ADC 1 Fail	-	Automatic reversion to ADC 2 should occur
COMM	-	HF1, VHF 3, SATCOM (optional)
NAV	-	FMS 3, NAV 3
Display	-	DU 2
Alerts and Annunciations	-	TCAS, TAWS, Windshear, RAD ALT 1

<<END>>

R DISTRIBUTION BUS FAIL

DISTR Bus Fail (C), R caution message indicates that the right distribution bus voltage is less than 19V for more than 5 seconds, or less than 5V for more than 1 second.

NOTE

This message is a collector CAS message.

The following messages come on

Caution messages:

> Yaw Damper 1-2 Fail
> Q Feel Fail
> Stick Pusher Fail
> Mach Trim Fail
> CPCS Fail Select MAN
> ADS 1 Probe HT FL

Advisory messages:

> Rudder TCM Fail
> L AOA Heat Fail

1. Electrical synoptic ..... Monitor electrical loads
2. If yaw damper is failed ..... Revert to other AFCS cabinet (SMC-SENSOR)
3. R BATT.....VERIFY ON
4. CPCS MODE .....MAN

NOTE

CPCS Manual Mode caution message comes on.

(Continued)

5. Airspeed / altitude ..... MAINTAIN BELOW 250 KCAS/0.70M_i

NOTE

Above 200 KCAS, anticipate lighter than normal elevator control forces.

6. Avoid icing conditions
7. Inhibit R CDU tuning ..... SMC - UTIL - TUNE REV
8. Land as soon as practicable

Systems affected by the failure:

Flight Controls	- Q Feel fail
ECS	AUTO PRESS CTRL and ALTN PRESS
	- Equipment cooling (AFT R/R, R Nose, DUs)
	- Cabin MAN TEMP CTRL
Anti Ice	- R Ice Detector, R Pitot Heat, R WS Heat.
ADC 2 Fail	- Automatic reversion to ADC 1 should occur.
COMM	- VHF 2, HF 2 (Opt), ACP 3(Opt)
NAV	- GPS 2, FMS 2, NAV 2, DME 2, ADF 2 (opt)
Display	- CCD 2, DU 3
IPC 2	- IFIS2 Fail (FMS2 / MAP2 / GFP2 Fail)
Alerts and Annunciations	- TCAS 2(Opt), TAWS 2(Opt), Windshear 2 (Opt), RAD ALT 2 (Opt)

<<END>>

L-R (DUAL) GENERATOR FAILURE (PRE MOD G25-20093)

Generator Fail, L-R caution message indicates that a dual generator failure has occurred. Electrical power is by batteries only or by APU if available.

Caution messages:

L-R DISTR Bus FL (C)
> CPCS Fail Select MAN (C)
> Q-Feel Fail
> Stick Pusher Fail
> A/T 1-2 Fail
> AP 1-2 Fail
> ADS 1-2 Probe HT FL
> Mach Trim Fail
> Yaw Damper 1-2 Fail
> TAT Probe Heat Fail

Advisory messages:

> Windshear Fail
> Ground PROX Fail
> RUD PDL Feedback Fail

CAUTION

MAXIMUM DESCENT TIME TO APU START ENVELOPE SHALL NOT EXCEED 20 MINUTES.

(Continued)

NOTE

Steps 1 through 13 are designed to reset system and provide alternate power supply.

1. Take manual control of aircraft
2. Dome light (at night)..... BRT
3. Airspeed / Altitude ..... MAINTAIN BELOW 250 KCAS / 0.70 M_i / 25,000 FT

CAUTION

IF DUTCH ROLL DEVELOPS DUE TO LOSS OF YAW DAMPER - COUNTERACT USING YOKE, DEPLOY HALF SPEED BRAKES.

NOTE

Above 200 KCAS, anticipate lighter than normal elevator control forces due to loss of Q-Feel

4. L and R GCU cb (A3,A13).....VERIFY IN
5. ELECTRICAL RESET ..... PRESS

NOTE

If generator(s) reset is successful, the following CAS messages will remain active: Q-Feel Fail caution message and Rudder TCM FAIL + Rudder MAINT REQD advisory messages.

6. CPCS MODE ..... MAN
7. Inhibit R AND C CDU from tuning .....SMC-UTIL-TUNE REV
8. DSP 2 and DCP 2 cb's (P12, P13) ..... PULL

NOTE

This action will turn off R SMC, inhibit SMC menu operation and shed load. STBY BUS to enable SMC 1 for 60 minutes.

(Continued)

9. Exit / avoid icing conditions

CAUTION

1. OPERATION OF PROBE OVRD IS PERMITTED FOR 7 MINUTES MAXIMUM.
2. CAUTION: ONLY THREE APU START ATTEMPTS ARE POSSIBLE ON BATT POWER. APU CANNOT BE STARTED IF EMER BUS WAS SELECTED TO BATT ON.

10. Start APU below 35,000 ft
11. APU MASTER.....ON
12. APU START .....PRESS
13. APU GEN..... ON; MONITOR LOADS

NOTE

APU operation limited to 40,000 ft.

If APU GEN is available and powers aircraft - Continue to L-R (DUAL) DISTRIBUTION BUS FAILURE, Page IIIA-118

If APU or APU GEN has failed:

14. ATC 2 .....SELECT, SET 7700 (l CDU - TUNE - ATC)

CAUTION

IF ENGINE START IS REQUIRED, PERFORM THE START PRIOR TO SELECTING EMER BUS TO BATT ON. SELECTING EMER BUS TO BATT ON WILL PREVENT FUEL STBY PUMPS FROM OPERATING.

(Continued)

15. EMER BUS ..... BATT ON

NOTE

The following caution messages come on: Emergency BATT On, Main Bus Fail (C), L-R, DISTR Bus Fail (C), L-R, Stick Pusher Fail.

16. Land at nearest suitable airport
17. Perform normal landing

If EMER BATT was selected - the following systems are inoperative:

Flight Controls	-	Q Feel, Rudder Pedal Feedback, AP 1-2, AT TQA, YD 1-2, R stick shaker, stick pusher
ECS	-	AUTO Cabin PRESS CTRL and ALTN PRESS
	-	Equipment cooling (AFT R/R, R Nose, DUs)
	-	Cabin and cockpit MAN TEMP CTRL
Anti-ice	-	L-R W/S and S/W Heat
	-	L-R ice detectors
Instruments	-	ADC 2
Navigation	-	FMS 2, NAV 2-3, DME 1-2, GPS 2
Displays	-	DU 2-3, CDU 2-3, CCD 2
Communication	-	VHF 2-3, HF 1-2, SATCOM, ACP 3, ATC 1
Alerts	-	TCAS, RADALT TAWS 1-2, (windshear, terrain)

Automatic load-shed items:

- L-R DISTR bus
- L-R windshield heat (windshield heat OVRD will NOT recover the system even with APU GEN ON).
- Baggage compartment heat
- Utilities - 60H_Z inverter, galley, cabin
- Water heaters and waste system

<<END>>

L-R (DUAL) GENERATOR FAILURE (POST MOD G25-20093)

Generator Fail, L-R caution message indicates that a dual generator failure has occurred. Electrical power is by batteries only or by APU if available. When APU is started according to this procedure, the aircraft can attain a positive rate of climb as long as APU GEN is within limits.

Caution messages:

>L-R DISTR Bus FL (C)
>L-R Generator Fail
L-R Battery Discharge
> Stick Pusher Fail
STBY BAT Discharge
> A/T 1-2 Fail
> AP 1-2 Fail
> ADS 1-2 Probe HT FL
> Mach Trim Fail
> Yaw Damper 1-2 Fail
> TAT Probe Heat Fail
> Q-Feel Fail
> CPCS Fail Select MAN

Advisory messages:

TCAS STBY
RUDDER TCM FAIL
R WAI Default Mode
EFIS Comparator Fail
R AOA Heat Fail;

CAUTION

MAXIMUM DESCENT TIME TO APU START ENVELOPE SHALL NOT EXCEED 20 MINUTES.

(Continued)

NOTE

Steps 1 through 13 are designed to reset system and provide alternate power supply.

1. Take manual control of aircraft
2. Dome light (at night)..... BRT
3. Airspeed / Altitude ..... MAINTAIN BELOW 250 KCAS / 0.70 M_i / 25,000 FT

CAUTION

IF DUTCH ROLL DEVELOPS DUE TO LOSS OF YAW DAMPER - COUNTERACT USING YOKE, DEPLOY HALF SPEED BRAKES.

NOTE

Above 200 KCAS, anticipate lighter than normal elevator control forces due to loss of Q-Feel

4. L and R GCU cb (A3,A13).....VERIFY IN
5. ELECTRICAL RESET ..... PRESS

NOTE

If generator(s) reset is successful, the following CAS messages will remain active: Q-Feel Fail caution message and Rudder TCM FAIL + Rudder MAINT REQD advisory messages.

6. CPCS MODE ..... MAN
7. Inhibit R AND C CDU from tuning .....SMC-UTIL-TUNE REV
8. DSP 2 and DCP 2 cb's (P12, P13) ..... PULL

NOTE

This action will turn off R SMC, inhibit SMC menu operation and shed load. STBY BUS to enable SMC 1 for 60 minutes.

(Continued)

9. Exit / avoid icing conditions

CAUTION

1. OPERATION OF PROBE OVRD IS PERMITTED FOR 7 MINUTES MAXIMUM.
2. CAUTION: ONLY THREE APU START ATTEMPTS ARE POSSIBLE ON BATT POWER. APU CANNOT BE STARTED IF EMER BUS WAS SELECTED TO BATT ON.
3. APU CANNOT BE STARTED IF EMER BUS WAS SLECTED TO BATT ON.

10. Start APU below 25,000 ft

NOTE

APU GEN Overload message might come on momentarily when APU GEN is the only source. If the message stays longer than 10 seconds descend to increase APU load capability.

11. APU MASTER.....ON
12. APU START .....PRESS
13. APU GEN..... ON; MONITOR LOADS

NOTE

APU operation limited to 40,000 ft.

If APU GEN is available and powers the aircraft

14. Autopiot, Auto-throttle and YAW damper..... RE-ENGAGE
15. DCP2 and SDSP2 CBs (P12, P13).....RESET

(Continued)

NOTE

Once APU GEN is online main batteries are charging and L DISTR BUS is powered. CAS messages will reduce to reflect the loss of R DISTR BUS only. APU GEN load will start high and decrease gradually to a stable value once battery charging is completed after about 20 minutes. After the load is stable and YAW DAMPER is engaged, on pilot's discretion, it is allowable to climb up to APU operating envelope limits, as long as APU GEN load is below 100%.

A climb rate of about 1000 ft/min can keep APU load below 100% up to APU envelope limit of 40,000 ft. If APU load is approaching 100% load, level off to reduce load.

16. *Continue to* R DISTRIBUTION BUS FAIL, Page IIIA-122

If APU or APU GEN has failed:

17. ATC 2 .....SELECT, SET 7700 (l CDU - TUNE - ATC)

CAUTION

IF ENGINE START IS REQUIRED, PERFORM THE START PRIOR TO SELECTING EMER BUS TO BATT ON. SELECTING EMER BUS TO BATT ON WILL PREVENT FUEL STBY PUMPS FROM OPERATING.

(Continued)

18. EMER BUS .....BATT ON

NOTE

The following caution messages come on: Emergency BATT On, Main Bus Fail (C), L-R, DISTR Bus Fail (C), L-R, Stick Pusher Fail.

19. Land at nearest suitable airport
20. Perform normal landing

If EMER BATT was selected - the following systems are inoperative:

Flight Controls	-	Q Feel, Rudder Pedal Feedback, AP 1-2, AT TQA, YD 1-2, R stick shaker, stick pusher
ECS	-	AUTO Cabin PRESS CTRL and ALTN PRESS
	-	Equipment cooling (AFT R/R, R Nose, DUs)
	-	Cabin and cockpit MAN TEMP CTRL
Anti-ice	-	L-R W/S and S/W Heat
	-	L-R ice detectors
Instruments	-	ADC 2
Navigation	-	FMS 2, NAV 2-3, DME 1-2, GPS 2
Displays	-	DU 2-3, CDU 2-3, CCD 2
Communication	-	VHF 2-3, HF 1-2, SATCOM, ACP 3, ATC 1
Alerts	-	TCAS, RADALT TAWS 1-2, (windshear, terrain)

Automatic load-shed items:

- L-R DISTR bus (Left side recovered with APU GEN ON automatically)
- L-R windshield heat (Left side recovered with windshield heat OVRD selected, APU GEN ON).
- Baggage compartment heat
- Utilities - $60H_Z$ inverter, galley, cabin
- Water heaters and waste system

<<END>>

SINGLE GENERATOR FAILURE

Generator Fail, L or Generator Fail, R caution message indicates engine electrical generator failure.

Electrical load of the failed generator is automatically transferred to the operating generator except for the following automatic load-shed items:

- Windshield heat
- Baggage compartment heat
- 60HZ Inverter
- Galley
- Water heaters
- Cabin non-essential loads

1. Electrical loads ..... Monitor electrical loads

NOTE

If there are voltage indications but load is 0%, check synoptic for open line contactor (no reset possible).

2. ELECTRICAL RESET ..... PRESS

If failure persists:

3. Failed generator ..... OFF
4. Failed GCU cb (A3 for L GCU OR A13 for R GCU) ..... CYCLE
5. Failed Generator ..... ON
6. ELECTRICAL RESET ..... PRESS

NOTE

Consider APU start. See APU START (IN FLIGHT), Page IV-12.

If unable to avoid Icing Conditions and failure persists:

7. WINDSHIELD HEAT OVRD ..... OVRD

<<END>>

GENERATOR OVERLOAD

GEN Overload, L or GEN Overload, R caution message indicates that one engine electrical generator load exceeds 100%.

NOTE

There is no automatic load shedding for this failure. The GCU will perform protective trip as function of overload level.

1. Electrical synoptic .....MONITOR ELECTRICAL LOADS

NOTE

Consider APU start. See APU START (IN FLIGHT), Page IV-12.

2. Load reduction items for consideration:
   - **a. GALLEY..... OFF**
   - d. $60H_Z$ INVERTER.....OFF
   - e. CABIN .....OFF
   - f. WINDSHIELD HEAT - RH.....OFF

If failure persists:

3. APU.....START (BELOW 35,000 FT)
4. APU GEN.....ON
5. Affected GEN .....OFF

If failure persists:

6. For further load shedding, affected DISTR BUS CB (L-B2, R-B12) .....PULL
7. Land at nearest suitable airport
8. Continue with affected distribution bus failure procedure: L DISTRIBUTION BUS FAIL, Page IIIA-120 or R DISTRIBUTION BUS FAIL, Page IIIA-122

<<END>>

STBY BUS FAILURE

NOTE

This procedure only applies when no generated power (from the engines or APU) is being provided to the electrical system (battery power only condition) and STBY battery has failed.

Following CAS messages and indications display:

FCP A Fail - Altitude preselector, BARO setting change from HSI menu

SMC 1-2 Fail
CPCS Fail Select MAN
Yaw Damper 1-2 Fail
AP 1-2 Fail - FCP
A/T 1-2 Fail
CPCS Maintenance REQD
CPCS LFE Fail
AP SRVO OVRD Fail
AP STAB Trim Fail
Mach Trim Fail

FD - red flag on PFD

CAUTION

DO NOT FOLLOW FLIGHT DIRECTOR AS IT IS AT LAST COMMAND PRIOR TO FAILURE.

1. Take manual control of the aircraft
2. Airspeed / altitude ..... MAINTAIN BELOW: 250 KCAS / 0.70 M_i / 25,000 FT

CAUTION

IF DUTCH ROLL DEVELOPS DUE TO LOSS OF YAW DAMPER - COUNTERACT USING YOKE, DEPLOY HALF SPEED BRAKES.

3. ATC ..... ADVISE UNABLE RVSM
4. Land as soon as practicable.

<<END>>

ATA 27 - FLIGHT CONTROLS

JAMMED ELEVATOR

NOTE

1. If the elevators are jammed, pitch control may be regained and maintained by disconnecting the left and right yokes. The crew needs to determine which side is not jammed and transfer flight control to that side.
2. If the right side is jammed, the stick pusher, autopilot pitch control and the Q-feel are unavailable.

1. Stabilizer Trim .....USE FOR PITCH CONTROL
2. Airspeed ..... 220 - 240 KCAS;

(Continued)

3. Autopilot ..... VERIFY DISCONNECTED

CAUTION

1. A LARGE PITCH TRANSIENT FORCE LEADING TO EXCEEDING AIRCRAFT LOAD FACTOR LIMITS IS POSSIBLE AT THE MOMENT OF ELEVATOR DISCONNECT IF ABOVE 250 KCAS. ATTEMPT TO MINIMIZE CONTROL COLUMN MOVEMENT AS THE DISCONNECT BREAKS FREE. TIME PERMITTING, ADVISE PASSENGERS TO REMAIN SEATED WITH SEAT BELTS FASTENED PRIOR TO DISCONNECT.
2. TO DISCONNECT, PUSH OR PULL BOTH ELEVATOR CONTROL COLUMNS SIMULTANEOUSLY IN THE SAME DIRECTION (95 LB OF FORCE) WHILE SLIGHTLY TRIMMING IN THE OPPOSITE DIRECTION.

4. Elevator controls ..... DISCONNECT

NOTE

1. To disconnect, push or pull BOTH elevator control columns simultaneously in the same direction. (95 lb of force).
2. Elevator Disconnect caution message comes on.

5. Pilot flying..... DECLARE
(BASED ON FREE ELEVATOR CONTROL)
6. Land at nearest suitable airport

(Continued)

Landing:

NOTE

1. It is recommended to perform a shallower approach to reduce use of elevators during touch down.
2. Calculate Landing distance according to V_{REF} +10 kts.

7. Maintain thrust for V_{REF} + 5 to 10 kts down to touch down.
8. Auto-throttles..... DISCONNECT at 100 ft AGL; (to prevent auto throttle retard at 50 ft)
9. Thrust Levers .....IDLE AT 30 ft.
10. Thrust reversers..... AS REQUIRED

<<END>>

JAMMED ROLL CONTROL

NOTE

1. Roll control jam may be caused by jammed ailerons or a jammed control wheel yoke.
2. Roll control may be regained and maintained by disconnecting the left and right yokes.

1. Autopilot ..... DISCONNECT
2. Ailerons disconnect lever (pilot yoke only) ..... PULL

NOTE

1. It is recommended to disconnect ailerons with centered yokes.
2. Pilot Aileron DISC caution message comes on.
3. Autopilot is not available when ailerons are disconnected.
4. If pilot yoke is in control, expect light and constant lateral control wheel forces without positive yoke centering.

3. Pilot flying ..... DECLARE
(BASED ON FREE YOKE AND AIRPLANE RESPONSE)

Which pilot has aircraft control?
PILOTGo to step 5
COPILOTGo to step 4

4. Roll Assist Disconnect ..... DISC

NOTE

Roll Assist DISC caution message will come on.

5. Land at nearest suitable airport

(Continued)

NOTE

Prior to landing, a controllability check is recommended at a safe altitude. Aircraft should be incrementally configured for landing and controllability verified for each configuration change. Airspeed should be gradually reduced to approach speed in accordance with the configuration changes.

6. Landing runway ..... SELECT WIDEST RUNWAY AVAILABLE WITH MINIMUM CROSSWIND COMPONENT
7. Autobrakes ..... HIGH
8. Normal landing ..... PERFORM

<<END>>

JAMMED HORIZONTAL STABILIZER

Stabilizer Jam caution message comes on when the stabilizer is jammed.

WARNING

DO NOT USE STAB TRIM, ALTERNATE STAB OR AUTOPILOT.

NOTE

Flaps/STAB compensation and speed brakes/STAB compensation are inoperative.

1. Airspeed ..... MAINTAIN CURRENT SPEED

NOTE

AP STAB Trim Fail caution message may be displayed.

2. Autopilot ..... DISCONNECT
3. Aircraft configuration ..... DO NOT CHANGE

NOTE

Excessive pitch force may occur.

(Continued)

4. Land at nearest suitable airport

Approach

5. Use flaps 20° or LND according to elevator control force.

NOTE

- If nose down control force is required, use flap LND.
- If nose up control force is required, use Flap 20°.
- if excessive nose up control force is required, consider Flaps 10° or 0°.

6. Landing performance.....Recalculate according to flaps setting (see ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147)
7. Plan a long final
8. Aircraft control.....BY COPILOT

NOTE

High force application (95 lb) on pilot yoke will disconnect the elevators.

9. TAWS/FLAP OVRD..... ON (IF FLAPS NOT LND)
10. Auto-brakes..... HIGH

Landing

NOTE

1. It is recommended to perform a shallower approach to reduce use of elevators during touch down.
2. Calculate Landing distance according to V_{REF} +10 kts.

11. Maintain thrust for V_{REF} + 5 to 10 kts down to touch down
12. Auto-throttles..... DISCONNECT at 100 ft AGL;
    ..... (to prevent auto throttle retard at 50 ft)
13. Thrust Levers..... IDLE AT 30 ft.
14. Thrust reversers..... AS REQUIRED

<<END>>

FCECU 1 FAILURE

FCECU 1 Fail (C) caution message indicates that FCECU 1 (Flight Control Electronic Control Unit) has failed.

NOTE

This message is a collector CAS message.
The following CAS come on:

Caution messages:
FCECU 1 Fail (C)
> Ground Spoilers Fail
> Flaps/STAB SYNC Fail
> OTBD Spoilers Fail

Advisory messages:
AP SRVO OVRD Fail

The following systems are inoperative:

- Primary stabilizer trim
- Ground spoilers
- Outboard spoilers
- Elevator - loss of HOPS
- Aileron Trim - loss of trim and indications to EICAS
- STAB trim indicators, until ALTN STAB is selected

The following systems are affected:

- Rudder – Operated by the lower actuator at a reduced rate
- Synoptic - failed surfaces are crossed out.
- Inboard spoilers will open normally as ground spoilers on touch down

NOTE

AP STAB Trim Fail caution message comes on if airspeed or pitch is changed.

1. Take manual control of aircraft

(Continued)

2. ALTN STAB ..... ARM

NOTE

Reduced stabilizer trim rate at low airspeed. Alternate STAB Arm caution message comes on. AP Engage Inhibit advisory message comes on

3. ATC ..... ADVISE (unable RVSM)
4. Land at nearest suitable airport
5. Calculate landing performance according to flaps position and apply for the following penalties:
   a. Calculate landing performance according to APPROACH AND LANDING - ABNORMAL FLAP SETTINGS

Flaps position	Performance figures: Landing Weight Limitation / V_{REF} / Actual Landing Distance	Increase ALD per flap position by
0°	Figure 5-297	8%
10°	Figure 5-293	10%
20°	Figure 5-289	15%
LDN	Figure 5-278	25%

FCECU 2 FAILURE

FCECU 2 Fail (C) caution message indicates that FCECU 2 (Flight Control Electronic Control Unit) has failed.

NOTE

This message is a collector CAS message.
The following CAS come on:

Caution messages:

FCECU 2 Fail (C)
> Q-Feel Fail
> Primary Flaps Fail
> Flaps/STAB SYNC Fail
> INBD Spoilers fail

The following systems are inoperative:

- Q-feel
- Inboard spoilers
- Primary flaps
- Elevator – Loss of HOPS

The following systems are affected:

- Rudder – Operated by the upper actuator at a reduced rate

CAUTION

1. EXPECT SENSITIVE PITCH CONTROL AT AIRSPEEDS OF MORE THAN 150 KCAS.
2. IF AUTOPILOT IS INOPERATIVE, MAINTAIN AIRSPEED BELOW 200 KCAS / 0.75M_i.

(Continued)

1. Autopilot. ..... ENGAGE

NOTE

Flight envelope is not limited when using the autopilot.

2. FLAPS lever ..... MATCH FLAPS POSITION
3. ALTN FLAP ..... ON
4. Land at nearest suitable airport.
5. Increase landing distance by 10% due to loss of inboard spoilers. (for any flaps positions)

If Alternate Flaps Fail *caution message is on, ALTN flaps is inoperative and Flaps can not move:*

6. Landing performance ..... RECALCULATE
7. Perform ABNORMAL FLAPS CONFIGURATION LANDING, page IIIA-147

<<END>>

FLAPS JAM

Did the Flaps Jam ***message appear during flap retraction and flaps indication is between 0° and 10°?***

YES — ***GO TO STEP*** 1

NO — ***GO TO STEP*** 9

1. Airspeed ..... 200 KIAS OR LESS
2. Attitude .....WINGS LEVEL
3. Altitude ..... MAINTAIN CURRENT ALTITUDE IF PRACTICAL
4. FLAP LEVER .....SET 10°

Did flaps extend to 10° and Flaps Jam ***message clear?***

YES — ***GO TO STEP*** 5

NO — ***GO TO STEP*** 9

5. FLAP Lever ..... UP

Did flaps retract and Flaps Jam ***message clear?***

YES — ***GO TO STEP*** 6

NO — ***GO TO STEP*** 9

6. Flight ..... CONTINUE
7. Flaps .....AFTER LANDING PERFORM FULL CYCLE
8. Flaps Jam event.....LOG FOR MAINTENANCE

<<END>>

If Flaps Jam ***message remains or flaps do not retract***

9. FLAP LEVER ..... DO NOT MOVE
10. Airspeed and Altitude .....REMAIN WITHIN LIMITS FOR INDICATED FLAP SETTING
11. If flap indication is not 0° ..... LAND AT NEAREST SUITABLE AIRPORT
12. PERFORM ABNORMAL FLAPS CONFIGURATION LANDING, Page IIIA-147

<<END>>

ABNORMAL FLAPS CONFIGURATION LANDING

1. V_{REF} ..... SET FOR FLAPS CONFIGURATION
   Figure 5-289 for flaps - 20°
   Figure 5-293 for flaps - 10°
   Figure 5-297 for flaps - 0°
2. Landing distance ..... CALCULATE ACCORDING TO FLAPS CONFIGURATION
   Figure 5-289 for flaps - 20°
   Figure 5-293 for flaps - 10°
   Figure 5-297 for flaps - 0°
3. Maximum landing weight
   allowable by tire speed limit ..... CALCULATE
   Figure 5-289 for flaps - 20°
   Figure 5-293 for flaps - 10°
   Figure 5-297 for flaps - 0°
4. TAWS/FLAP OVRD ..... ON

NOTE

Select TAWS/FLAPS OVRD pushbutton to ON prevents nuisance "*TOO LOW FLAPS*" aural alert.

If landing configuration is Flap 0°, reduce to minimum landing weight

5. Fuel jettison ..... AS REQUIRED
6. AIRSPEED ..... CONTROL IN MAN SPD MODE (FCP-MAN)

NOTE

In Flaps 0° configuration, the AUTO SPEED mode will slow aircraft to Vref when entering terminal airspace.

(Continued)

CAUTION

1. IF NO FLAPS LANDING IS DUE TO THE LOSS OF LEFT HYDRAULIC SYSTEM (LEFT HYDRAULIC SYSTEM FAILURE, page IIIA-176), THE FOLLOWING SYSTEMS WILL BE UNAVAILABLE:
   - Ground spoilers
   - Outboard spoilers
   - OUTBOARD BRAKES
   - Left T/R
2. ROLL ASSIST AND SPEED BRAKES OPERATION IS DEGRADED.

V_{REF} For Abnormal Flaps Configurations

Gross Weight (LB)	Flaps 20°	Flaps 10°	Flaps 0°
39,000	145	151	191
38,000	142	149	188
37,000	140	147	185
36,000	138	145	183
35,000	136	143	180
34,000	134	141	177
33,000	132	138	174
32,000	130	136	171
31,000	128	134	169
3,0000	126	132	166
29,000	124	130	163
28,000	122	127	160
27,000	120	125	157
26,000	118	123	154
25,000	115	121	151

NOTE

The V_{REF} values in the table above refer to sea level landing field elevation.
For each 1000 ft above MSL add 1 kt.

<<END>>

RUDDER FAILURE

Rudder Fail caution message indicates a complete loss of rudder operation.

NOTE

1. Yaw Damper is inoperative. dutch roll may be experienced.
2. TCM is not available.

1. Autopilot ..... ENGAGE
2. Altitude ..... DESCEND BELOW 25,000 FT
3. Airspeed ..... MAINTAIN BELOW 250 KCAS / 0.7 M_i
4. Land at nearest suitable airport
5. Use longest and widest runway available

CAUTION

MAXIMUM CROSSWIND IS 7 KT.

6. Fuel balance ..... MAINTAIN
7. Flight controls synoptic ..... VERIFY RUDDER POSITION (ZERO)
8. Auto brakes ..... HIGH
9. Perform BEFORE LANDING, Page IV-37
10. Upon touchdown ..... LOWER NOSE TO RUNWAY

(Continued)

11. Directional control:
    a. Maintain using NWS (NWS through rudder pedal steering still available)

CAUTION

MINIMIZE TILLER INPUTS AT HIGH SPEED TO AVOID OVER CONTROL, PIO AND POSSIBLE LOSS OF CONTROL.

g. Use differential braking if required

NOTE

Applying brakes will disconnect the auto brakes

<<END>>

RUDDER PEDAL COMMAND FAILURE

Rudder Pedal CMD Fail caution message indicates the loss of more than two rudder pedal sensors. Rudder pedal command inputs will not activate the rudder surface.

NOTE

1. Rudder control is available by rudder trim switch up to approximately 1/3 of maximum rudder displacement.
2. NWS and TCM mode are operative.

1. Land as soon as practicable
2. Use longest and widest runway available

CAUTION

MAXIMUM CROSSWIND IS 7 KT.

3. Fuel balance ..... MAINTAIN
4. Auto brakes..... HIGH
5. Perform BEFORE LANDING, Page IV-37
6. Upon Touchdown ..... LOWER NOSE TO RUNWAY
7. Runway directional control:
   a. Maintain using NWS

CAUTION

MINIMIZE TILLER INPUTS AT HIGH SPEED TO AVOID OVER CONTROL, PIO AND POSSIBLE LOSS OF CONTROL

h. Use differential braking if required

<<END>>

STABILIZER TRIM RUNAWAY

NOTE

Pilot or co-pilot's STAB trim switch command is stuck.

1. Take manual control of the aircraft
2. Pilot STAB trim switch ..... .TRIM OPPOSITE TO RUNAWAY
3. ALTN STAB ..... ARM

If failure persists:

4. ALTN STAB ..... OFF
5. STAB position..... DETERMINE
   (0° to -3° for cruise or below -4° for landing)
6. STAB MCU and ALTN STAB cb (F7, F17) ..... PULL

Approach and Landing:

7. Airspeed..... MAINTAIN MINIMUM OF V_{REF} + 10 KT FOR FLAPS SETTING
8. Select the longest available runway
9. Aircraft CG ..... CONSIDER SHIFTING ACCORDING TO CONTROL FORCES
10. Flaps configuration:
    a. Consider flaps position according to elevator control force tendency:
    If pushing forward on the yoke - use LND flaps
    If pulling aft on the yoke - use Flaps 20°;
    if excessive pull forces are required - consider flaps 10° or 0°
11. Landing performance ..... CALCULATE

Flaps position	Performance figures: Landing Weight Limitation / V_{REF} / Actual Landing Distance
0°	Figure 5-297
10°	Figure 5-293
20°	Figure 5-289

(Continued)

12. Perform BEFORE LANDING, Page IV-37
13. TAWS/FLAP OVRD..... ON (IF NOT FLAPS LND)
14. Auto brakes..... HIGH
15. Final ..... V_{REF}+10 KT FOR FLAPS SETTING

Landing

16. Avoid large or abrupt pitch attitude and thrust changes

<<END>>

Q-FEEL FAILURE

NOTE

If Q-feel fails, the FCECU defaults to Q-feel gains set for a speed below 200 kt.

IF FAILURE OCCURRED ABOVE 200 KCAS (UP TO V_{MO}/M_{MO}):

1. Autopilot. .....ENGAGE

NOTE

Flight envelope is not limited when using the autopilot

2. Q-Feel cb (G12) ..... VERIFY IN

CAUTION

WHEN FLYING WITH MANUAL CONTROLS AT SPEEDS ABOVE 200 KCAS WITH A Q-FEEL SET AT DEFAULT GAINS, THE AIRCRAFT MAY BE SENSITIVE TO SMALL ELEVATOR INPUTS.

3. Airspeed.....REDUCE BELOW 200 KCAS WHEN PRACTICAL
4. Landing .....PERFORM NORMAL LANDING

If speed is below 200 KCAS:

5. Airspeed..... MAINTAIN BELOW 200 KCAS
6. Land at nearest suitable airport

<<END>>

STALL PROTECTION SYSTEM FAILURE

SP/Shaker Fail or Stick Pusher Fail caution messages not associated with takeoff indicate a lost of stall protection.

.

CAUTION

DURING FAILURE OF THE SP/STICK SHAKER, THERE WILL BE NO ARTIFICIAL WARNING BEFORE THE ACTUAL STALL. DO NOT EXCEED 0.66 NORMALIZED AOA.

If the Stick Pusher Fail caution message appears during takeoff:

Stick Pusher Fail caution message during takeoff indicates a temporary voltage drop to the AP Elevator Servo as both EMPs are activated when the thrust levers are advanced to takeoff power. The takeoff can be reattempted using the following procedure:

At least 10 seconds before takeoff

1. Both EMPs ..... ON

If the Stick Pusher Fail caution message does not come on or comes on and then goes off:

2. Normal Takeoff ..... PERFORM

After Takeoff

3. Both EMPs ..... OFF and ARM

If the Stick Pusher Fail caution message comes on and remains on:

4. Both EMPs ..... OFF and ARM
5. Do not Dispatch.

(Continued)

If the Stick Pusher Fail *caution message appears in flight:*

1. Respect the PLI (pitch limit indicator)
2. AP AIL SERVO (O3), AP ELEV SRVO (O4) cb's ..... CHECK

If AOA Miscompare *caution message is on:*

3. See AOA (ANGLE OF ATTACK) MISCOMPARE, page IIIA-217

NOTE

If AOA Probe Fail, L-R caution message comes on until leaving Icing conditions. The system will self-reset when outside of icing conditions

If stall protection system failure persists with no other related CAS message:

4. STICK PUSHER.....OFF

NOTE

Stick Pusher Off caution message is displayed

5. Approach..... V_{REF} + 10 KT

<<END>>

ATA 28 - FUEL

FUEL STANDBY PUMP INOPERATIVE

STBY Pump INOP, L, STBY Pump INOP, R *or* STBY Pump INOP, L-R *caution messages comes on when:*

- Fuel STBY PUMP is selected ON and the pump does not operate
- Fuel STBY PUMP is armed with low fuel pressure and the pump does not operate. (When engines generators are on line)
- Fuel Jettison is ON and the pump does not operate

NOTE

In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message.

If standby fuel pump is not on:

1. Indicated STBY FUEL PUMP.....OFF

NOTE

Fuel Pump Not Arm, L *or* Fuel Pump Not Arm, R *or* Fuel Pump Not Arm, L-R caution message will come on.

2. Indicated STBY FUEL PUMP.....ON

If both, L and R stby pump failed, STBY Pump INOP, L-R *caution messages comes on:*

NOTE

Fuel Jettison is not available. Fuel XFLOW is not available.

(Continued)

If single failure - STBY Pump INOP, L *or* STBY Pump INOP, R. *caution message comes on.*

NOTE

Fuel Jettison of both sides is available through Interconnect Valve only, with slower jettisoning rate. Fuel XFLOW - not available.

<<END>>

STANDBY PUMP ON

STBY Pump On, L, STBY Pump On, R or STBY Pump On, L-R caution message comes on when fuel STBY pump comes on:

- The STBY FUEL PUMP selected ARM position and the fuel pressure dropped below 4.5 psi
- The STBY FUEL PUMP selected OFF and the on-side FUEL JETTISON is OFF but the pump operates

NOTE

In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message.

If a fuel leak is suspected, see FUEL LEAK, page II-45

If Fuel Pressure Low, L-R, Fuel Pressure Low, L *or* Fuel Pressure Low, R *warning message or* Fuel Pressure Low, L-R, Fuel Pressure Low, L *or* Fuel Pressure Low, R *caution message is on*

CAUTION

LOW FUEL PRESSURE MAY CAUSE ENGINE FLAMEOUT ABOVE 25,000 FT. AVOID ABRUPT THRUST LEVER MOVEMENTS.

1. Affected side STBY FUEL PUMP .....ON

(Continued)

NOTE

. The message changes to STBY Pump On, L-R, STBY Pump On, L *or* STBY Pump On, R status message

If Fuel Pressure Low, L-R, Fuel Pressure Low, L *or* Fuel Pressure Low, R *warning message or* Fuel Pressure Low, L-R, Fuel Pressure Low, L *or* Fuel Pressure Low, R *caution message* persist - *see* FUEL PRESSURE LOW, Page II-49

If fuel pressure is normal and the STBY PUMP is ON regardless of the command, suspect an inoperative jet pump.

NOTE

Active balancing using Fuel XFLOW to the respective side is not available.

<<END>>

FUEL TANK TEMPERATURE LOW

Fuel Tank TEMP Low caution message comes on when the fuel tank temperature is approaching the minimum temperature for the selected fuel type.

NOTE

Fuel tank minimum temperatures:

- Jet A -38°C

For Jet A type fuel, the caution message comes on at -36°C. Continue monitoring the temperatures closely.

- Jet A1 -46°C
- JP-8 -46°C

1. Fuel synoptic DISPLAY
2. Fuel type ..... VERIFY (SMC-UTIL-FUEL or SEC EICAS)
3. Fuel tank temperature ..... MONITOR

If the indicated fuel temperature reaches the limits listed in 1-28-20: FUEL TANK TEMPERATURE, Page I-20

4. Perform steps 5 and/ or 6 as suitable to increase fuel tank temperature above limits.
5. Descend to altitude where SAT is above -60°C
6. Airspeed ..... .MAINTAIN ABOVE 0.8M_i
7. Fuel tank temperature ..... CONTINUE MONITORING
8. Mission performance ..... RE-CALCULATE OR CONSIDER DIVERSION

<<END>>

FUEL IMBALANCE

Fuel Imbalance caution message comes on when the FQMC has detected a fuel imbalance between wing tanks of more than 450 lb on the ground, or 900 lb in flight.

CAUTION

FUEL IMBALANCE MAY INDICATE A FUEL LEAK.

If fuel quantity in each wing tank is above 300 lb and there is no evidence of high fuel flow or fuel leak:

1. FUEL INTERCONNECT ..... OPEN

NOTE

Fuel INTER Valve Open status message will come on.

2. Fuel asymmetry ..... MONITOR

NOTE

Use a small sideslip if needed (slowly add rudder to the heavy wing side and bank towards the light wing).

When fuel balance is achieved:

3. FUEL INTERCONNECT ..... CLOSE

If fuel quantity in any wing tank is below 300 lb, or fuel balance is not achieved:

4. FUEL XFLOW ..... OPEN

NOTE

Fuel XFLOW Valve Open status message will come on. CAS will change to Fuel XFLOW Valve Open caution message 5 minutes after valve has been selected open.

(Continued)

5. “Heavy” tank FUEL STBY PUMP .....ON

NOTE

STBY Pump On, L or STBY Pump On, R status message will come on

When fuel balance is achieved:

6. FUEL XFLOW .....CLOSE
7. “Heavy” tank FUEL STBY PUMP .....OFF

<<END>>

FUEL INTERCONNECT VALVE FAILURE

Fuel INTER Valve Fail caution messages comes on when fuel interconnect valve has failed. Pilot commanded the valve to open position and it is closed, or pilot commanded the valve to close and it is open, or valve data in valid.

1. Fuel synoptic ..... DISPLAY

If the valve has failed closed and fuel balancing is required:

2. Fuel X FLOW ..... OPEN

NOTE

Fuel XFLOW Valve Open status message will come on. CAS will change to Fuel XFLOW Valve Open caution message 5 minutes after valve has been selected open.

3. "Heavy" wing FUEL STBY PUMP ..... ON
   STBY Pump On, L or STBY Pump On, R status message will come on

When fuel balance is achieved:

4. FUEL X FLOW ..... CLOSE
5. "Heavy" wing FUEL STBY PUMP ..... OFF

If the valve has failed open:

6. Fuel imbalance ..... MONITOR
7. AVOID SIDE SLIPS

<<END>>

FUEL JETTISON

NOTE

Avoid fuel jettisoning in the vicinity of lightning.

Normal jettison operation:

1. Both FUEL JETTISON .....ON

NOTE

message comes on. Verify FUEL JETT light illuminate in pushbuttons.

2. Fuel JETT On, L-R caution message.....VERIFY ON
3. Fuel synoptic.....DISPLAY
4. Fuel quantity and balance.....MONITOR

NOTE

1. Fuel jettison will stop automatically when fuel quantity reaches 800 lb on the respective side.
2. Jettisoned fuel is not included in the FUEL USED data on the FMS DATA page or FMS calculations.

When aircraft weight is sufficiently reduced:

5. Both FUEL JETTISON .....OFF
6. Fuel JETT On, L-R caution message.....VERIFY OFF

<<END>>

JETTISON VALVE FAILURE

JETT Valve Fail, L, JETT Valve Fail, R or JETT Valve Fail, L-R caution message comes on when:

- The valve was commanded to open and stays closed, and left fuel quantity (feed + wing tanks) is above 800 lb, or:
- The valve was commanded to close and stayed open, or:
- Valve data is invalid

If the valve failed close and affected side fuel jettison is required:

1. Fuel synoptic ..... DISPLAY
2. Opposite side FUEL JETT ..... ON

NOTE

Fuel JETT On, L or Fuel JETT On, R caution message will come on

3. FUEL INTERCONNECT ..... OPEN

NOTE

Fuel INTER Valve Open status message will come on

4. Fuel quantity ..... MONITOR CLOSELY

When the required fuel quantity is reached:

5. FUEL JETT ..... OFF

When fuel balanced is achieved:

6. FUEL INTERCONNECT ..... OFF

If the valve failed open (fuel jettisoning did not stop. JETT AUTO Stop INOP *caution message comes on:*

7. Fuel quantity ..... MONITOR
8. FUEL JETT ..... CYCLE ON THEN OFF
9. L and R JETTISON cb's (I8, I18) ..... CYCLE

(Continued)

If fuel jettison does not stop:

10. Affected FUEL STBY PUMP OFF/ARM .....NOT ARM

NOTE

Fuel Pump Not Arm, L *or* Fuel Pump Not Arm, R caution message will come on.

11. LAND AT NEAREST SUITABLE AIRPORT

NOTE

1. Gravity jettison stops when approximately 300 lb of fuel remain in each wing.
2. FQMC disables the jettison function (closes valve) if the affected side fuel quantity (wing + feed tanks) drops below 800 lb.

<<END>>

JETTISON AUTO STOP INOPERATIVE

JETT AUTO Stop INOP caution message *comes on for either of the following:*

- The automatic stopping of the fuel Jettison is inoperative
- The left or right wing fuel quantity is unavailable
- Different jettisons commands from FQMC1 and FQMC2
- Two wing fuel probes or one feed fuel probe have failed
- No fuel jettison has been commanded and the jettison valve is open

If fuel jettison is active and not required:

1. Both FUEL JETT .....CYCLE ON, THEN OFF

If failure persists:

2. L and R JETTISON cb's (I8, I18) ..... CYCLE
3. Fuel quantity ..... MONITOR

NOTE

1. Activating the fuel jettison with auto-stop feature inoperative is not recommended.
2. Consider using the SMC utilities clock alarm or other means to remind the crew to check fuel jettison status when auto-stop feature is inoperative.

If failure persists and fuel jettisoning continues:

4. Respective FUEL STBY PUMP OFF/ARM .....NOT ARM

NOTE

Fuel Pump Not Arm, L *or* Fuel Pump Not Arm, R caution message will come on.

5. Land at nearest suitable airport

NOTE

1. Gravity jettison will stop at approximately 300 lb remaining in each wing.
2. FQMC disables the jettison function (closes valve) in case the relevant side (wing + feed tanks) quantity drops below 800 lb.

<<END>>

FUEL MEASUREMENT DEGRADED

Check Fuel Quantity caution messages comes on when fuel tank quantity is lost in any of the tanks.

NOTE

Fuel transfer sequence (tanks depletion sequence):

- FWD (to wings)
- AFT (to wings)
- CTR (to wings)
- Wings (to feed tanks)
- Feed tanks

1. CDU - IDX - ENGINE/FUEL page ..... CHECK TOTAL AND WINGS QUANTITY
2. Fuel synoptic ..... DISPLAY
3. Determine which of the fuel tanks readings have failed
4. Fuel transfer sequence ..... MONITOR
5. Fuel management and flight range ..... MONITOR

<<END>>

FUEL TRANSFER FAULT

Fuel Transfer Fault caution message come on when fuel transfer sequence is failed.

Fuel transfer sequence (tanks depletion sequence):

- FWD (to wings)
- AFT (to wings)
- CTR (to wings)
- Wings (to feed tanks)
- Feed tanks

1. Fuel synoptic..... DISPLAY
2. Determine in which tank the fuel is trapped

NOTE

Amber feed lines between the tanks indicate wrong transfer sequence.

- FWD should be empty when total fuel is less than 13,000 lb
- AFT should be empty when total fuel is less than 12,000 lb
- CTR should be empty when total fuel is less than 9200 lb

If fuel is trapped in FWD tank:

1. Recalculate range without trapped fuel in FWD tank.

NOTE

Max fuel loss is 1710 lb.

(Continued)

If fuel is trapped in CTR tank:

2. Recalculate range without trapped fuel in CTR tank

NOTE

1. Max fuel loss of 2080 lb.
2. If the CTR tank is not feeding, fuel may also be trapped in the FWD and AFT tank increasing the maximum fuel loss to as much as 4830 lb.

If fuel is trapped in aft tank:

3. Recalculate range without trapped fuel in aft tank

NOTE

1. Max fuel loss of 1040 lb.
2. If the aft tank is not feeding, fuel may also be trapped in the forward tank increasing the maximum fuel loss to as much as 2750 lb.

4. Recalculate cg for landing weight. Consider shifting passengers forward
5. For extreme aft cg, consider flaps 20°/10° configuration for landing
6. Recalculate landing distance according to flaps setting selected

<<END>>

ATA 29 - HYDRAULIC

HYDRAULIC SYSTEM/COMPONENT AVAILABILITY PER FAILURE

(Sheet 1 of 2)

SYSTEM / COMPONENT	HYD System Fail (C), L	HYD System Fail (C), R	HYD SYS Fail (C), L-R
Elevators			Only manual
Q Feel		Low speed gains	Low speed gains
Ground Spoilers	Inoperative		Inoperative
Inboard Spoilers		Inoperative	Inoperative
Outboard Spoilers	Inoperative		Inoperative
Roll Assist	Degraded	Degraded	Inoperative
Air Brakes	Degraded	Degraded	Inoperative
Rudder	Single (not degraded)	Single (not degraded)	Inoperative (1)
Flaps	Inoperative		
HOPS	Inoperative	Inoperative	Inoperative
Landing Gear		Pneumatic accumulator (2)	Pneumatic accumulator (2)
Nose Wheel Steering		Inoperative	Inoperative
Inboard Brakes	Accumulator (3)		Accumulator (3)
Outboard Brakes		Accumulator (3)	Accumulator (3)
Parking			Accumulator (3)
L Thrust Reverser	Inoperative		Inoperative

HYDRAULIC SYSTEM/COMPONENT AVAILABILITY PER FAILURE

(Sheet 2 of 2)

SYSTEM / COMPONENT	HYD System Fail (C), L	HYD System Fail (C), R	HYD SYS Fail (C), L-R
R Thrust Reverser		Inoperative	Inoperative
Main Entrance Door	Inoperative		Inoperative

(1) Rudder trim, TCM and YD function are inoperative.

(2) Backup pneumatic accumulator for one time emergency extension of landing gear

(3) Hydraulic accumulator for brake operation. When braking on accumulator pressure it is recommended to perform one long pedal brake application down to full stop. Repeating pedal press will deplete brake's accumulator rapidly.

RIGHT HYDRAULIC SYSTEM FAILURE

HYD System Fail (C), R caution message indicates system pressure is below 1300 psi.

NOTE

This is a Collector (C) message. Flight control (SA) messages may be displayed.

1. Airspeed.....BELOW 250 KCAS / 0.7M_i
2. R HYD EMP ON.....PRESS ON

Did HYD System Fail (C) caution message clear?

YES:
- Maintain 39,000 ft or below
- Land as soon as practicable

NO: **<<END>>**

3. Hydraulic synoptic..... DISPLAY
4. R HYD EMP ..... DEPRESS NOT ARM & OFF
5. Right hydraulic reservoir temperature..... MONITOR

NOTE

EMP HYD Pump Not Arm, R caution message will come on

The following systems will be affected as follows:.

SYSTEM	STATUS	RESULTS
L & R Inboard Spoilers	Inoperative	
Q-Feel	Low speed gains	Low pitch forces at high airspeed
Right T/R	Inoperative	Use only left T/R at idle
Inboard wheel brakes	Accumulator only	No auto-brakes. Anti Skid is operative
Elevators	Single actuator for each elevator	Not significant
Rudder	Single rudder	Not significant
Nose Wheel Steering	Inoperative	Use differential braking
Landing Gear Extension	Pneumatic accumulator backup only	EMERGENCY EXTENSION

(Continued)

CAUTION

AS Q FEEL FAILS, PITCH FORCES ARE MUCH LIGHTER AT AIRSPEED ABOVE 200 KTS G LOAD LIMITS SHOULD BE MONITORED.

Is HYD Reservoir Hot, R *caution message on?*

YES:
- Perform engine shutdown:

R Engine thrust lever ..... IDLE
R Engine FUEL CONTROL..... OFF

NO:
- Continue step 6.

CAUTION

DO NOT ROTATE RIGHT ENGINE FIRE HANDLE

R Engine FIRE handle ..... PULL ONLY

6. Land at the nearest suitable airport
7. Landing performance ..... Increase Landing Distance by 10%
8. Fuel Jettison..... USE TO REDUCE LANDING WEIGHT

CAUTION

EXTENDED LANDING GEAR CANNOT BE RETRACTED.

(Continued)

NOTE

1. Allow sufficient time to perform emergency gear extension before start of approach.
2. Roll response is degraded below 200 KCAS.
3. Configure aircraft for landing early.
4. In case of single engine approach with R hydraulic failure – landing gear cannot be retracted for a go around.

9. Perform emergency landing gear extension:
   a. Flaps 20º
   i. Airspeed ..... BELOW 175 KCAS
   j. Landing gear lever ..... DOWN
   k. Emergency gear handle ..... RELEASE, TURN, AND LIFT
   l. Landing gear ..... VERIFY DOWN AND LOCKED
10. NWS ..... DISCONNECT

NOTE

NWS INOP caution message comes on.

Before Landing:

11. Parking brakes ..... VERIFY OFF
12. Auto brakes ..... OFF
13. Flaps ..... SET
14. Landing gear ..... DOWN / 3 GREEN

Was R engine shut down during this procedure?

YES:
- Flaps ..... 20°
- TAWS FLAP OVRD ..... ON
- Approach speed ..... V_{REF} FOR 20° FLAPS + 5 KT

NO:
- Flaps ..... LND
- Airspeed ..... V_{REF} + 5 KT

After touch down and aircraft nosewheel on ground:

15. Brakes (pedals) ..... AS REQUIRED
16. Use rudder and differential braking for directional control
17. Left T/R ..... AS REQUIRED

<<END>>

LEFT HYDRAULIC SYSTEM FAILURE

HYD System Fail (C), L caution messages indicate that system pressure is below 1300 psi.

NOTE

This is a collector (C) message. Flight control SA messages may be displayed.

1. EMP ..... PRESS ON

Did HYD System Fail (C), L *caution message clear?*

YES:
- Maintain 39,000 ft or below
- Land as soon as practicable

NO:
- Go to step 2

2. Hydraulic synoptic ..... DISPLAY
3. L HYD EMP ..... DEPRESS NOT ARM & OFF

NOTE

EMP HYD Pump Not Arm, L caution message will come on

The following systems will be affected as follows:.

SYSTEM	STATUS	RESULTS
Flaps	Inoperative	Abnormal landing configuration
L & R ground spoilers	Inoperative	Landing distance penalty
L & R Outboard Spoilers	Inoperative	
Left T/R	Inoperative	Use only right T/R at idle
Outboard wheel-brakes	Accumulator Only	No Auto-Brakes. Anti skid is available
Elevators	Single piston in each actuator	Not significant
Rudder	Single rudder	Not significant
Main entrance door up-motion	Inoperative	Manual operation

(Continued)

Is HYD Reservoir Hot, L *caution message on?*

YES:

- Perform engine shutdown:

L Engine thrust lever ..... IDLE
L Engine FUEL CONTROL ..... OFF

CAUTION

DO NOT ROTATE RIGHT ENGINE FIRE HANDLE

L Engine FIRE handle ..... PULL ONLY

NO:

- Continue step 4.

4. Land at nearest suitable airport.
5. Calculate landing performance according to flaps position and apply the following penalties:

Flaps position	Performance figures: Landing Weight Limitation / Vref / Actual landing distance	Increase ALD per flap position by
0°	Figure 5-297	8%
10°	Figure 5-293	10%
20°	Figure 5-289	15%
LND	Figure 5-284	25%

6. ATC ..... Advise & request long runway and wide approach
7. Fuel jettison ..... CONSIDER FOR LOWER LANDING WEIGHT

(Continued)

Before Landing:

8. Parking brakes ..... VERIFY OFF
9. Auto-brakes ..... OFF
10. TAWS/FLAPS OVRD ..... AS REQUIRED
11. Flaps ..... LAST CONFIGURATION
12. Landing gear lever ..... DOWN; 3 GREEN
13. Airspeed ..... APPROPRIATE TO CONFIGURATION
14. Autopilot ..... DISCONNECT
15. Autothrottle ..... AS REQUIRED

On final:

:

WARNING

IF GO AROUND IS REQUIRED, APPLY THRUST GRADUALLY

16. Glide path ..... AS REQUIRED TO MAINTAIN Vref
17. Touch-down ground speed ..... 182 KCAS MAXIMUM
18. Minimize float . Plan early touchdown to reduce the use of ailerons
19. Wheel brakes ..... AS REQUIRED
20. Right thrust reverser ..... AS REQUIRED

<<END>>

LEFT AND RIGHT (DUAL) HYDRAULIC SYSTEMS FAILURE

HYD SYS Fail (C), L-R caution message indicate both left and right hydraulic system pressures are below 1300 psi.

NOTE

The message is a collector CAS message. Flight control SA messages may be displayed.

1. Autopilot ..... ENGAGE (FOR ROLL AXIS)

NOTE

1. AP Roll Axis Only (C) caution message will come on. Pitch mode is not controlled by this Autopilot mode and STAB trim can be used as required. This mode controls only the roll axis to damp the Dutch roll oscillations that may develop if above 25,000 ft / 0.7M_i / 250 kt. This mode compensates for loss of yaw damper function due to loss of rudder.
2. Autopilot in this mode will not disconnect for Stick Shaker event.

2. Controllability:
   a. Use STAB trim to compensate for high pitch forces

NOTE

When flying in manual reversion, pitch force is higher and pitch response is sluggish. Aircraft maneuverability is degraded.

m. Do not exceed 30° bank angle

(Continued)

3. Both HYD EMP ON ..... PRESS ON

Did HYD SYS Fail (C), L-R *caution message clear?*

YES:
- Maintain 39,000 ft or below
- Land at nearest suitable airport

NO:
- If one system is restored, proceed to the procedure associated with the displayed failure message. Go to HYD System Fail (C), L or HYD System Fail (C), R.
- If both system remain failed — Go to step 4.

4. Hydraulic synoptic ..... DISPLAY
5. Both HYD EMP ..... DEPRESS NOT ARM & OFF

NOTE

EMP HYD Pump Not Arm, L-R caution message will come on.

The following systems will be affected as follows:.

SYSTEM	STATUS	RESULTS
Elevators	Degraded Power	Manual reversion control. (Use STAB trim to aid in pitch control). Refer to OIS 3 ELEVATORS MANUAL REVERSION if time permits
Q-Feel	Defaults to low speed forces	Low pitch forces. Avoid abrupt pitch inputs which can overload aircraft.
Rudder	Inoperative	Crosswind limit - 7 kt
Flaps	Inoperative	Abnormal flaps configuration
Both Inboard spoilers	Inoperative	Roll rate and authority significantly reduced.
Both Outboard spoilers	Inoperative	
Landing gear extension	Inoperative	Emergency extension
Nose Wheel System	Inoperative	Use differential braking
Normal Wheel brakes	Use Accumulators	No Autobrake
Thrust reversers	Inoperative	Unable contaminated runways.

(Continued)

6. Land at the nearest suitable airport
7. Calculate landing performance according to flaps position and apply for the following penalties:
   a. Calculate landing performance according to flaps position and apply the following penalties:

Flaps position	Performance figures: Landing Weight Limitation / Vref / Actual landing distance	Increase ALD per flap position by
0°	Figure 5-297	15%
10°	Figure 5-293	20%
20°	Figure 5-289	30%
LND	Figure 5-284	50%

8. ATC ..... Advise & request long runway and wide approach and aircraft will require shut down on runway.
9. Fuel jettison..... CONSIDER FOR LOWER LANDING WEIGHT

CAUTION

ONCE EXTENDED, LANDING GEAR CANNOT BE RETRACTED.

NOTE

1. Allow sufficient time to perform emergency gear extension before beginning approach.
2. Handling qualities are affected when flying at speed below 200 KCAS.

10. Perform EMERGENCY LANDING GEAR EXTENSION:
    a. Airspeed .....BELOW 175 KCAS
    n. Landing gear lever .....DOWN
    o. Emergency gear extension handle .....RELEASE, TURN, AND LIFT
    p. Landing gear .....VERIFY DOWN AND LOCKED

(Continued)

11. NWS ..... DISCONNECT

NOTE

NWS INOP caution message comes on.

Before Landing:

12. Parking brakes ..... VERIFY OFF
13. Auto brakes ..... OFF
14. Landing gear ..... DOWN/ 3 GREEN
15. Airspeed ..... V_{REF} + 10, APPROPRIATE TO CONFIGURATION
16. Autopilot ..... DISCONNECT
17. Auto throttles ..... DISCONNECT

CAUTION

FLARELESS LANDING - USE STAB TRIM TO REDUCE PITCH FORCE FOR FLARE. OVER TRIMMING CAN CAUSE BALLOONING EFFECT.

NOTE

Retard thrust gradually when ground effect is felt (approximately 30 ft).

(Continued)

After Touch down and aircraft nose lowered:

CAUTION

MINIMIZE ANY WHEEL BRAKES APPLICATIONS PRIOR TO TOUCHDOWN AS IT DEPLETES HYDRAULIC BRAKING ACCUMULATORS

18. Wheel brakes .. CONTINUOUS BRAKING DOWN TO FULL STOP

NOTE

It is recommended to use about half brake pedal deflection during braking in order to minimize any possible skids that may increase hydraulic braking accumulators depletion.

19. Directional control ..... USE AILERONS TO KEEP WINGS LEVEL

<<END>>

HYDRAULIC RESERVOIR HOT / HYDRAULIC PRESSURE HIGH

HYD Reservoir Hot, R, HYD Reservoir Hot, L or HYD Reservoir Hot, L-R caution message indicates that the respective hydraulic fluid temperature is (are) above limit.

HYD Pressure High, L, HYD Pressure High, R or HYD Pressure High, L-R caution message indicates the respective hydraulic pressure is (are) above the 3500 psi limit.

1. HYD synoptic ..... DISPLAY
2. L and R HYD system fluid quantity..... CHECK
3. HYD reservoirs temperature ..... MONITOR
4. Demand of affected HYD system..... DECREASE
5. Affected side(s) HYDRAULIC EMP (OFF/ARM & ON)..... NOT ARM & OFF

NOTE

EMP HYD Pump Not Arm, L *and / or* EMP HYD Pump Not Arm, R caution message will come on.

If temperature is high on both hydraulic systems:

6. Land at nearest suitable airport

WARNING

PERFORM THE FOLLOWING STEPS FOR ONE ENGINE ONLY.

If temperature continues to rise:

7. Corresponding engine thrust..... IDLE

If temperature is at or above 135°C (275°F):

NOTE

If both systems reach 135°C, right engine shutdown is recommended.

(Continued)

8. Affected engine FUEL CONTROL.....OFF

CAUTION

DO NOT ROTATE FIRE HANDLE DURING THE NEXT STEP

9. Affected engine FIRE handle.....PULL ONLY
10. Proceed to the indicated hydraulic system failure procedure, RIGHT HYDRAULIC SYSTEM FAILURE, page IIIA-173 or LEFT HYDRAULIC SYSTEM FAILURE, page IIIA-176

<<END>>

ATA 30 - ICE/RAIN PROTECTION SYSTEM

L-R WAI SYSTEM FAIL

WAI System Fail *CAS message indicates that:*

- BOTH WAI (Wing Anti Ice) systems have failed, or
- The WAI Cross-Over valve is not in the correct position.

On Ground:

If WAI System Fail *caution CAS message appeared when WAI system is not operating (engines are running):*

1. L and R WAI switches .....ON

If the failure clears and wings warm up as required (No WAI System Fail *caution CAS come-on), flight into icing condition is approved only with both engine bleed and both WAI systems operating.*

NOTE

WAI System Fail caution CAS message reappear when the WAI system is turned OFF.

2. L and R WAI switches ..... AS REQUIRED

If WAI System Fail *caution CAS message remains or comes on after WAI system activation:*

3. Flight into icing condition is prohibited
4. L and R WAI switches .....OFF

in air:

1. Depart icing condition
2. L and R WAI switches .....OFF

(Continued)

CAUTION

1. FOR ANY WING ANTI ICING FAILURE, IF ICING CONDITIONS WERE MET WHILE WINGS ARE COLD, USE VREF +20 KT FOR APPROACH AND LANDING, AND INCREASE LANDING DISTANCE BY 40%.
2. DO NOT EXCEED TIRE SPEED LIMITATIONS (182KT GROUND SPEED).

<<END>>

WING ANTI ICE OPERATION ON SINGLE SOURCE

Use this procedure when either one WAI system or one Engine Bleed system is failed.

1. Altitude ..... BELOW 26,000

CAUTION

WING ANTI ICE OPERATION ON SINGLE BLEED SOURCE IS NOT APPROVED ABOVE 26,000 FT.

2. Non-operating side:
   a. ENG Bleed ..... OFF
   q. WAI Switch ..... OFF
3. Operating side:
   a. ENG Bleed ..... ON
   r. WAI Switch ..... ON
4. Isolation valve ..... CLOSED
5. Bleed/Anti Ice synoptic ..... DISPLAY
6. Wing Anti Ice temperatures ..... MONITOR

CAUTION

1. FOR ANY WING ANTI ICING FAILURE, IF ICING CONDITIONS WERE MET WHILE WINGS ARE COLD, USE VREF +20 KT FOR APPROACH AND LANDING, AND INCREASE LANDING DISTANCE BY 40%.
2. DO NOT EXCEED TIRE SPEED LIMITATIONS (182KT GROUND SPEED).

<<END>>

WAI XOVER Fail Close

WAI XOVER Fail Close CAS message indicates that the WAI Cross-Over valve has failed in the closed position.

NOTE

This CAS message is accompanied by the WAI System Fail CAS message.

WARNING

IN CASE OF WAI CROSS-OVER VALVE BEING FAILED CLOSED, WING ANTI-ICE OPERATION IS PROHIBITED IF ONLY ONE BLEED OR ONLY ONE WAI SYSTEM IS OPERATIVE (NO "SINGLE-SOURCE" CROSS-HEATING CAPABILITY). FLIGHT INTO ICING CONDITION IS ALLOWED ONLY WITH BOTH ENGINE BLEEDS AND BOTH WAI SYSTEMS OPERATING.

If the WAI system is not active:

1. L and R WAI switches ..... ON
2. WAI System and XOVER Failures Messages .... VERIFY EXTINGUISHED
3. L and R WAI switches ..... AS REQUIRED

NOTE

WAI XOVER Fail Close and WAI System Fail CAS message will reappear if WAI switches are turned OFF.

If the WAI system was active prior to WAI failure messages in SINGLE source (Single Engine, Single Bleed or Single WAI system available):

4. Operating Side WAI switch ..... OFF
5. DEPART ICING CONDITIONS

<<END>>

WAI XOVER Fail Open

WAI XOVER Fail Open CAS message indicates that the Wing Anti Ice Cross-over valve failed in the Open position with both Bleeds and both WAI systems operating.

NOTE

This CAS message is accompanied by the WAI System Fail CAS message.

If malfunction appears below 26,000 ft:

1. Left ENG Bleed ..... OFF
2. Left WAI switch..... OFF
3. Thrust Levers ..... AS REQUIRED
4. Descent below 26,000 ft or depart icing condition.

NOTE

1. WAI XOVER Fail Open and WAI System Fail CAS message will not display when one ENG Bleed is selected OFF.
2. BAS Off, L CAS message will come on after selecting ENG Bleed to OFF.

When out of Icing Conditions:

5. Left ENG Bleed ..... ON
6. Thrust Levers ..... AS REQUIRED

<<END>>

PROBE HEAT FAILURE

ADS 1 Probe Heat Fail *caution message is on, indicates loss of electrical power to L PITOT*

1. Circuit breaker D4 ..... RESET ONCE or CYCLE ONCE

ADS 2 Probe Heat Fail *caution message is on, indicates loss of electrical power to R PITOT*

1. Circuit breaker D14 ..... RESET ONCE or CYCLE ONCE

ADS 1-2 Probe Heat FL *caution message is on, indicates loss of electrical power to L AND R PITOT.*

1. Circuit breaker D4, D14 ..... RESET ONCE or CYCLE ONCE

STBY Probe Heat Fail *caution message is on, indicates loss of electrical power to: STBY PITOT*

1. Circuit breaker E6 ..... RESET ONCE or CYCLE ONCE

TAT Probe Heat Fail *caution message is on, indicates loss of electrical power to: Total Air Temperature (TAT).*

1. Circuit breaker E3 ..... RESET ONCE or CYCLE ONCE

AOA Heat Fail, L *or* AOA Heat Fail, R *advisory message is on, indicates loss of electrical power to L AOA or R AOA.*

1. Circuit breaker D5, D16 ..... RESET ONCE or CYCLE ONCE

If CB did not trip or recycle failed:

NOTE

When cb has tripped, OVRD function is disabled.

2. PROBES HEAT ..... OVRD
3. Avoid icing conditions.

If Icing conditions are unavoidable

4. ADS..... SELECT SMC-SNSR-ADS - NON AFFECTED SIDE

(Continued)

NOTE

Air data flag will display on PFDs indicating single source data.

5. ATC .....Advise NON-RVSM

After landing:

6. PROBES HEAT ..... AUTO

<<END>>

ICE DETECTOR FAILURE

Ice Detector Fail, L, Ice Detector Fail, R or Ice Detector Fail, L-R caution message is displayed.

CAUTION

DO NOT USE AUTO ANTI ICE MODES. REMAINING ICE DETECTOR IS ADVISORY ONLY. DEFINE ICING CONDITIONS ACCORDING TO VISUAL QUES (VISIBLE MOISTURE AND TAT BELOW 10°C).

If not in Icing Conditions:

1. Both ENG ANTI ICE .....OFF
2. Both WING ANTI ICE .....OFF

If icing conditions are encountered:

1. Both ENG ANTI ICE .....ON
2. Both WING ANTI ICE .....ON

<<END>>

ATA 31 - INDICATION AND RECORDING SYSTEMS

CONTINUOUS NUISANCE AURAL WARNING

If continuous nuisance aural waning occurs:

1. CAS AURAL INHIBIT ..... SELECT (SMC-TEST)

CAUTION

MONITOR THE FOLLOWING SYSTEMS AS ALL AURAL ALERTS ARE INHIBITED: AFCS DISENGAGEMENTS, NEW CAS MESSAGE, ALTITUDE ALERTS.

2. Cockpit must be manned by both pilots
3. Increase monitoring of AFCS modes and altitude, and CAS window.

<<END>>

ATA 32 - LANDING GEAR AND BRAKES

BRAKE OVERHEAT

Brake Overheat caution message comes on when wheel brakes temperature exceeds 450ºC.

NOTE

In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message.

On ground:

1. Brakes synoptic ..... DISPLAY
2. Overheated brake(s) ..... DETERMINE AND AVOID USE
3. Reverse thrust ..... AS REQUIRED

NOTE

Minimize taxi while attempting to park with a isolated hot brake. Parking into the wind is preferred.

4. Aircraft ..... STOP/CHOCK

CAUTION

DO NOT SET PARKING BRAKE.

(Continued)

5. Brake temperatures ..... MONITOR TREND

WARNING

STAY CLEAR OF THE MAIN LANDING GEAR AREA FOR A MINIMUM 30 MINUTES; DO NOT STAND IN FRONT OR BEHIND TIRES.

CAUTION

IF TEMPERATURE CONTINUES TO RISE OR REMAIN ABOVE OVERHEAT LIMIT FOR MORE THAN 5 MINUTES, EXPECT WHEEL FUSE PLUGS TO RELEASE.

If temperature continues to rise or remain above overheat limit for more than 5 minutes:

6. PERFORM EMERGENCY EVACUATION, page II-87

After Brake Overheat *caution message is off:*

7. All brake(s), wheel(s) and tire(s) ..... INSPECT

CAUTION

FOR SUBSEQUENT TAKEOFF THERE MAY NOT BE SUFFICIENT BRAKE KINETIC ENERGY AVAILABLE IN THE EVENT OF A REJECTED TAKEOFF. ALSO, TIRE FAILURE MAY OCCUR ON TAKEOFF ROLL.

<<END>>

ANTI-SKID FAILURE

Anti-skid Fail caution message indicates that anti-skid system is not available.

CAUTION

1. EXCEEDING BRAKES SKID LIMIT MIGHT CAUSE SEVERE DAMAGE OR BLOWN TIRES. DO NOT EXCEED 600 PSI BRAKE PRESSURE.
2. DECREASE BRAKE PRESSURE AS AIRPLANE DECELERATES TO PREVENT SKIDDING, BLOWING TIRES AND/OR ABRUPT STOPPING.

NOTE

Auto brakes are unavailable.

1. Brakes system synoptic ..... DISPLAY
2. Calculate landing distance

NOTE

Add 50% penalty to actual landing distance with anti-skid inoperative.

3. Normal landing ..... PERFORM
4. Thrust reversers ..... MAXIMUM REVERSE THRUST
5. Wheel brakes ..... APPLY

<<END>>

BRAKE CONTROL UNIT FAILURE

Brake CTRL Unit Fail caution messages indicate that normal braking system is not available (loss of brake by wire).

1. Brakes synoptic..... DISPLAY
2. INBD BRKS and OUTBD BRKS cb's (G6, G16)..... CYCLE

If failure persists:

3. Landing performance .....Increase Landing Distance by 60%

CAUTION

1. ANTI-SKID PROTECTION IS NOT AVAILABLE.
2. GROUND SPOILERS WILL NOT OPEN UPON TOUCHDOWN DUE TO LOSS OF WHEEL SPEED TRANSDUCERS (WST) SIGNALS.

After touchdown:

4. If GND Spoiler Auto Fail caution message is on .....EXTEND SPEED BRAKE ON TOUCHDOWN.
5. Thrust Reversers ..... USE MAX REVERSE THRUST

CAUTION

1. ABRUPT LEVER PULL WILL BLOW TIRES.
2. DO NOT EXCEED 600 PSI BRAKE PRESSURE (SKID LIMIT) WHEN PULLING PARKING BRAKE HANDLE.
3. DO NOT APPLY NORMAL BRAKES WHILE USING PARK BRAKE LEVER.

(Continued)

6. PARK BRAKE ..... PULL AS REQUIRED

CAUTION

DECREASE BRAKE PRESSURE AS AIRPLANE DECELERATES TO PREVENT SKIDDING, BLOWING TIRES AND/OR ABRUPT STOPPING.

<<END>>

NO BRAKING ON ONE STRUT

Brakes Fail,L or Brakes Fail, R caution message indicates that two brakes on the same strut are not available.

NOTE

1. Anti-skid not available.
2. Anticipate a 100% increase in landing distance.

1. Brakes synoptic..... DISPLAY

If pressure is available for affected side (check with gear down and PARK BRAKE handle applied), see BRAKE CONTROL UNIT FAILURE, Page IIIA-197, *step* 4

2. Normal landing..... PERFORM
3. Thrust Reversers ..... USE MAX REVERSE THRUST
4. Operative wheel brake ..... AS REQUIRED
5. Directional control .....MAINTAIN USING RUDDER AND NWS

CAUTION

1. EXPECT OPERATIVE BRAKE TO OVERHEAT. IF BRAKE FIRE IS NOTICED - EVACUATE PASSENGERS THROUGH THE SIDE OPPOSITE OF THE FIRE.
2. DO NOT EXCEED 600 PSI BRAKE PRESSURE (SKID LIMIT) WHEN USING THE AVAILABLE BRAKE.

<<END>>

SINGLE CHANNEL BRAKE FAILURE

OUTBD Brake Fail or INBD Brake Fail caution messages indicates that one braking channel not available.

NOTE

1. Anti-skid function available on operative channel.
2. Anticipate 35% increase in actual landing distance.

1. Brakes synoptic ..... DISPLAY
2. Affected circuit breakers
   (INBD BRKS -G16 or OUTBD BRKS -G6) ..... CYCLE
3. Normal landing ..... PERFORM
4. Thrust reveres ..... MAX / AS REQUIRED
5. Wheel brakes ..... APPLY AS REQUIRED
6. After landing ..... MONITOR BRAKES TEMPERATURE

<<END>>

SINGLE WHEEL SPEED TRANSDUCER (WST) FAILURE

OUTBD Brake Degrade, L, OUTBD Brake Degrade, R or INBD Brake Degrade, L or INBD Brake Degrade, R advisory message indicate loss of a single WST (Wheel Speed Transducer). The brake control unit will command 50% braking pressure (up to a limit of 600 psi) of adjacent brake on same strut.
Affected brake pressure indication on the brake synoptic is cyan.

NOTE

1. Anti Skid available.
2. Auto brakes are unavailable.
3. Anticipate increase of 11% in Actual landing distance.

1. Normal landing ..... PERFORM
2. Thrust reveres ..... AS REQUIRED
3. Wheel brakes ..... APPLY AS REQUIRED
4. After landing ..... MONITOR BRAKES TEMPERATURE

<<END>>

UNCOMMANDED BRAKING

Uncommanded Brake caution message indicates that pressure detected when PARK BRAKE not set and pedals not depressed.

During takeoff below V_1:

1. Takeoff.....ABORT

Before landing:

WARNING

EXPECT TIRE TO BLOW UP OR DEFLATE SHORTLY AFTER TOUCHDOWN.

2. Brake synoptic.....DISPLAY
3. INBD and OUTBD brakes cb's (G6,G16).....CYCLE

If failure persists:

4. Jettison fuel as required to reduce landing weight
5. Select longest runway available with minimal crosswind
6. Perform normal landing
7. Directional control .....MAINTAIN

<<END>>

WOW MISCOMPARE

WOW Miscompare caution message indicates that either nose left or right main landing gear Weight On Wheel (WOW) signal has failed to shift to appropriate mode or is invalid.

NOTE

1. Expect LG Maintenance REQD and BCS Maintenance REQD advisory messages to come on.
2. When BCS Maintenance REQD advisory messages is on, auto brakes are disabled.

1. Flight controls synoptic .....DISPLAY; CHECK WOW STATUS
2. Thrust reversers.. MUST STOW ABOVE 20 KT GROUND SPEED

NOTE

Expect TRs Stow Above 20 KTS caution message after touchdown. TR remains deployed if not stowed above 20 kt and maintenance action will be required.

If right WOW displays G *in flight:*

3. Activate the right side window defog manually, using the OVRD pushbutton
4. No automatic cabin load shedding in emergency

If right WOW displays A *on ground:*

5. Disable right side window defogging; pull D3 cb

If left WOW displays G *in flight:*

6. If required, activate the left side window defog manually, using the OVRD pushbutton
7. If LG retraction is required:
   a. LG DOWNLOCK OVERRIDE ..... DEPRESS AND HOLD
   s. Landing gear lever ..... UP
8. No automatic inverter load shedding if generator fails

(Continued)

9. Expect APU Maintenance REQD advisory messages to come on

If left WOW displays A *on ground:*

CAUTION

LANDING GEAR LEVER CAN BE EASILY MOVED TO UP POSITION.

10. Landing gear pins..... IN
11. Do not leave APU unattended as APU FIRE horn will not operate
12. Expect APU Maintenance REQD advisory messages to come on
13. Disable left side window defogging; pull D12 cb

If nose wheel WOW displays A *on ground:*

NOTE

Expect NWS INOP caution message when aircraft on ground / touchdown.

14. NWS.....OFF
15. Maintain directional control using rudder and differential braking
16. Disable pitot heat ..... Pull D4, D14 cb's

If nose wheel WOW displays G *in flight:*

17. Pitot heat is inhibited. Use OVRD pushbutton to heat probes and static hole as required
18. Check ATC 1, ATC 2 and TCAS status
19. Trend vector is not displayed

<<END>>

LANDING GEAR FAILURE TO RETRACT

1. Airspeed ..... BELOW 195 KCAS

Is Landing Gear lever at full UP position?

YES - Go to Step 4.
NO - *Can Landing Gear lever be moved from the DOWN position?*
YES - Go to Step 4.
NO - Can Landing Gear stay down for remainder of flight?
YES - Go to Step 7.
NO - Continue with Step 2.

2. DOWNLOCK OVERRIDE pushbutton ..... PRESS & HOLD
3. Landing Gear lever ..... UP

NOTE

If WOW Miscompare caution message is displayed, proceed to WOW MISCOMPARE, Page IIIA-203 AFTER landing gear unsafe indications are resolved.

Did Landing gear retract normally?
YES - Continue flight - END OF PROCEDURE
NO - Go to Step 7.

4. Landing Gear lever ..... DOWN
5. Landing Gear indications ..... VERIFY 3 DOWN
6. Landing Gear lever ..... UP

Did Landing gear retract normally?
YES - Continue flight - END OF PROCEDURE
NO - Go to Step 7.

7. Landing Gear lever ..... DOWN

(Continued)

Did landing gear extend normally - landing gear indications show 3 DOWN?

YES - Land as soon as practicable - END OF PROCEDURE

NO - Go to EMERGENCY LANDING GEAR EXTENSION, Page IIIA-209

NOTE

If weight is above maximum landing weight - consider fuel jettison

<<END>>

LANDING GEAR DOWNLOCK FAILURE / UNSAFE INDICATION

If, during landing gear extension, IN TRANSIT *indication is persistent for more than 12 seconds and* DN *indication does not appear:*

1. Verify landing gear lever is at full extent of travel in the DOWN position
2. Flaps lever .....20°
3. Airspeed..... REDUCE TO MINIMUM FOR CURRENT AIRCRAFT CONFIGURATION (V_{REF} for Flaps 20° + 5 KT)
4. Flight controls synoptic ..... DISPLAY
5. Right hydraulic pressure .....CHECK

If pressure indication is 1200 psi or below, proceed to EMERGENCY LANDING GEAR EXTENSION, page IIIA-209*:*

6. Landing gear lever ..... UP; MONITOR INDICATION CHANGES

After 30 seconds minimum:

7. Landing gear lever ....DOWN; MONITOR INDICATION CHANGES

NOTE

1. If any DN indication is still off or in transit, it may indicate landing gear failure to lock down.
2. For Nose gear positive downlock indication - select TAXI light pushbutton to ON and ask tower to observe taxi light. The taxi light only comes on if the nose gear is down and locked.

(Continued)

***If only Nose landing gear downlock indication is unsafe**:*

8. Landing Gear Lever - MOVE UP ABOUT ONE INCH FOR 10 SECONDS OR UNTIL NOSE GEAR INDICATES DOWN THEN MOVE LEVER FULL DOWN.

NOTE

- R hydraulic pressure reading will drop when handle is moved up.
- Do not move lever more than half way up since landing gear will start to retract.

If downlock indications are still abnormal:

9. Perform ABNORMAL LANDING GEAR CONFIGURATIONS, page IIIA-210

<<END>>

EMERGENCY LANDING GEAR EXTENSION

CAUTION

1. LANDING GEAR LEVER MUST STAY IN DOWN POSITION.
2. ONCE EXTENDED, LANDING GEAR CANNOT BE RETRACTED.

1. Flaps lever .....20°
2. Airspeed..... BELOW 175 KCAS
3. Landing gear lever .....DOWN
4. EMERGENCY GEAR DOWN handle RELEASE, TURN AND LIFT
5. Landing gear .....DOWN, 3 GREEN

If downlock indications are still abnormal:

6. Attempt to release or lower by applying positive 'g' loading not to exceed 2.0 g with flaps down (2.6 g with flaps up)

If downlock indications are still abnormal:

7. Perform ABNORMAL LANDING GEAR CONFIGURATIONS, page IIIA-210

<<END>>

ABNORMAL LANDING GEAR CONFIGURATIONS

Perform LANDING GEAR DOWNLOCK FAILURE / UNSAFE INDICATION, page IIIA-207, and EMERGENCY LANDING GEAR EXTENSION, page IIIA-209 procedures, if not already completed, prior to performing this procedure.

1. Passengers ..... BRIEFED AND PREPARED
2. Cabin baggage..... SECURED
3. Select long runway with minimal crosswind
4. Aircraft weight .....REDUCE

On approach (below 3000f t AGL):

5. Do not arm auto brakes for landing
6. TAWS VOICE OVRD.....ON
7. APU.....OFF
8. PACK.....OFF
9. DUMP.....ON
10. Flaps .....LND
11. Both hydraulic EMPs.....ON
12. Sink rate .....MINIMIZE AT TOUCHDOWN
13. For recommendation of landing technique see:
    NOSE GEAR UNSAFE, BOTH MAIN GEARS DOWN AND LOCKED, Page IIIA-211,
    ONE MAIN GEAR UNSAFE, NOSE GEAR DOWN AND LOCKED, AND ONE MAIN GEAR DOWN AND LOCKED, Page IIIA-212,
    NOSE AND ONE MAIN GEAR UNSAFE, ONE MAIN DOWN AND LOCKED, Page IIIA-212,
    BOTH MAIN GEARS UNSAFE, NOSE GEAR DOWN AND LOCKED, Page IIIA-213.
    ALL GEAR UP LANDING, Page IIIA-213

<<END>>

NOSE GEAR UNSAFE, BOTH MAIN GEARS DOWN AND LOCKED

1. Touchdown.....RUNWAY CENTERLINE
2. Speed brakes..... .AS REQUIRED
3. Nose..... .FLY THE NOSE GENTLY TO THE GROUND .....BUT DO NOT TRY TO HOLD IT OFF
4. Thrust reversers.....USE MAX
5. Directional control ..... MAINTAIN
6. Engine FUEL CONTROLS.....OFF
7. After stopping, perform EMERGENCY EVACUATION, Page II-87 if required.

If nose landing gear has not collapsed but still indicates unsafe:

8. Do not taxi off the runway.

If nose landing gear indicates down and locked after landing:

9. Pin the landing gear before attempting taxing.
10. Perform AFTER LANDING procedures.

<<END>>

ONE MAIN GEAR UNSAFE, NOSE GEAR DOWN AND LOCKED, AND ONE MAIN GEAR DOWN AND LOCKED

NOTE

NWS and ground spoilers are unavailable in this configuration due to loss of WOW feedback after touchdown.

1. Touchdown ..... OFF CENTER TOWARD THE LOCKED GEAR
2. Speed brakes ..... EXTEND
3. Wings level ..... MAINTAIN UNSAFE GEAR WING IN THE AIR UNTIL LOSS OF AILERON EFFECTIVENESS
4. Directional control ..... MAINTAIN
5. Do not use thrust reversers unless stopping distance is critical
6. Engine FUEL CONTROLS ..... OFF
7. After stopping, perform EMERGENCY EVACUATION, Page II-87 if required

If main landing gear has not collapsed but still indicates unsafe:

8. Do not taxi off the runway.

If main landing gear indicates down and locked after landing:

9. Pin the landing gear before attempting taxing.
10. Perform AFTER LANDING procedures.

<<END>>

NOSE AND ONE MAIN GEAR UNSAFE, ONE MAIN DOWN AND LOCKED

RETRACT GEAR and perform an all gear up landing. Proceed to ALL GEAR UP LANDING, Page IIIA-213

<<END>>

BOTH MAIN GEARS UNSAFE, NOSE GEAR DOWN AND LOCKED

If unable to extend and lock down both main gear, retract gear and perform all gear up landing. Proceed to ALL GEAR UP LANDING, Page IIIA-213

<<END>>

ALL GEAR UP LANDING

NOTE

Do not deploy speed brakes during this procedure.

1. Landing fuel ..... 1000 LB MAXIMUM
2. Final approach configuration..... FLAPS 39° / V_{REF}
   Use final approach speed of V_{REF} or as slow as possible at all Planned wheels up landing weights and fly a very shallow approach angle
3. Sink rate.....TARGET LOW AT TOUCHDOWN
   Flap segments are likely to break clean away from the wing at touchdown
4. Touchdown.....RUNWAY CENTERLINE
5. When aft fuselage contacts runway surface, immediately shut down both engines using Engine FUEL CONTROL switches
6. Directional Control .....MAINTAIN WITH RUDDER
   Pull control column to the full aft position during the remainder of the ground run to maintain a nose high attitude
7. When airplane stopped:
   a. Both FIRE handles.....PULL
   t. Both BATT's and STBY BATT.....OFF
8. Passengers/crew ..... EVACUATE AIRCRAFT

<<END>>

OVERWEIGHT LANDING

IF landing at a weight in excess of maximum landing weight is unavoidable:

1. Runway ..... USE LONGEST AVAILABLE

CAUTION

MAIN LANDING GEAR MAXIMUM TIRE SPEED IS 195 KT GROUND SPEED. NOSE LANDING MAXIMUM TIRE SPEED IS 182 KT GROUND SPEED.

NOTE

See APPROACH AND LANDING - FLAPS - 39°, Page V-763.

2. Sink rate and crab ..... MINIMIZE AT TOUCHDOWN
3. Reverse thrust..... USE MAXIMUM AVAILABLE PRIOR TO USING BRAKES
4. brakes ..... AS REQUIRED

When stopped:

5. BTMS ..... MONITOR
6. Log Overweight Landing for maintenance

<<END>>

ATA 34 - NAVIGATION SYSTEM

CHECK SMC AIRDATA

Check SMC - Airdata caution message indicates detection of a miscomparison between ADC 1, ADC 2 and RSE. The miscompare may be caused by RSE failure. If the RSE has failed, the ISI attitude display is black and the FCS Interface MAINT advisory message will also be displayed.

NOTE

Airspeed data is not reliable and rudder limiter function might default to FCECU default values which limit rudder according to flaps configuration.

If ISI attitude display is black proceed to ISI (Integrated Standby Instrument) Failure, Page IIIA-216

If one of the airspeed indications is frozen:

1. Compare airspeed indicator with cross side and ISI to determine correct
2. Land as soon as practicable

On approach

3. AOA ..... MAINTAIN 0.62 UNITS (V_{REF} + 5 KT):
4. Airspeed ..... USE RELIABLE AIRSPEED INDICATOR; MONITOR AOA - DO NOT EXCEED 0.66 UNITS
5. Perform BEFORE LANDING, Page IV-37
6. Landing ..... NORMAL LANDING

<<END>>

ISI (Integrated Standby Instrument) Failure

RSE has failed and the ISI attitude display is black. Red ATT and FPV flags may be displayed on ISI. Red IAS and ALT flags may be displayed if air data was lost.

1. Fast Erect.....PERFORM
   (Press STBY MENU pushbutton on DSP, than select Fast Erect on DCP)

If failure persists:

2. RSE CB (P15).....CYCLE
   (ISI realignment may take a minute.) FCS Interface MAINT advisory CAS may display when RSE CB is pulled.

If failure persists:

3. Select on side HDG source for ISI
   (HDG1 for L ISI and HDG2 for R ISI or HDG3 if IRS3 is installed).
4. Continue flight.

NOTE

If L and R airspeed indications on PFD's reliability is questioned - consider selecting Probe Heat to Override, monitor NAoA and continue to CHECK SMC AIRDATA, Page IIIA-215 procedure, step 3. If airspeed indications on PFDs are declared as unreliable - continue to UNRELIABLE AIRSPEED INDICATION, Page IIIA-218 procedure.

<<END>>

AOA (ANGLE OF ATTACK) MISCOMPARE

If AOA Miscompare caution message is on, it indicates that the Angle Of Attack (AOA) indicators has a difference of more then 4° in normal operation, or more then 7° with anti-icing operating (icing conditions).

CAUTION

STICK PUSHER IS UNAVAILABLE.

NOTE

1. AOA Miscompare caution message may come on during high side slip maneuvers and crosswind landings. Message is inhibited on ground.
2. The left PFD AOA displays the left AOA and the right PFD displays the right AOA.

If SP/Shaker Fail *caution message comes on, continue with* STALL PROTECTION SYSTEM FAILURE*,* page IIIA-155

1. Airspeed.....ABOVE 200 KCAS
2. Perform AOA comparison by gently changing attitude (5° up and 5° down) and determine the reliable indicator
3. Failed AOA circuit breaker (L AOA E5 or R AOA E16) ..... PULL

NOTE

AOA Probe Fail, L or AOA Probe Fail, R advisory message comes on accordingly.

The stall protection system is now re initialized and operable based on a single AOA probe. The AOA displays on both PFDs are based on single AOA probe.

<<END>>

UNRELIABLE AIRSPEED INDICATION

Unreliable airspeed indication can result from blocking of damaged pitot/static system (freezing, bird strike, radom damage).
This procedure intends to advise the pilot the approximate pitch attitude for each flight maneuver.

The following alerts may be displayed and activated during this event:
AP 1-2 Fail
Yaw Damper 1-2 Fail
RUD Fail Safe Value
FCECU Fail Safe Value
AOA Miscompare
IAS Flag
Overspeed warning

1. Return aircraft to target attitude and thrust setting for the flight regime; for starting point use UNRELIABLE AIRSPEED INDICATION TABLE, Page IIIA-219
2. Use ground speed from PFD or FMS (IDX-PROG-Page 2, or, GNSS status)
3. ATC ..... DECLARE EMERGENCY; REQUEST ALTITUDE FOLLOWING IF AVAILABLE
4. Consult AOA if reliable
5. FD ..... SELECT OFF
6. FPV ..... SELECT ON (SMC - PFD - ADI)
7. Transponder 7700
8. Perform ILS approach if available. Establish landing configuration early on final approach. Adjust thrust to maintain ground speed while maintaining glideslope
9. Landing ..... AIM TO TOUCH-DOWN 1000-1500 FT BEYOND THRESHOLD
10. Auto brakes ..... HIGH

(Continued)

When setting the pitch attitude and the corresponding thrust – aircraft performs according to flight phase and airspeed indicated in the following table.

Example – weight of 30,000 lb at altitude of 30,000 ft – set 75.2% N_1 and maintain 2.5° pitch attitude to cruise at 250 KCAS..

UNRELIABLE AIRSPEED INDICATION TABLE

ISA, ECS ON

(Sheet 1 of 2)

	Weight at Altitude (LB)	Altitude (FT)	Climb Speed (KCAS)	FLAPS	%N_1	Pitch Attitude (°)	NAOA
Climb	39600	1000	250	0	87.5	12.9	0.40
	38500	35000	250	0	93.0	5.4	0.70
	38500	40000	250	0	93.1	4.3	0.75
	30000	1000	250	0	87.5	15.5	0.30
	29500	35000	250	0	93.0	5.2	0.56
	29000	40000	250	0	93.1	4.0	0.66
Cruise	38000	30000	250	0	77.0	3.5	0.63
	35000	30000	250	0	76.3	3.1	0.58
	30000	30000	250	0	75.2	2.5	0.49
	38000	40000	0.76	0	83.9	4.6	0.79
	35000	40000	0.76	0	82.4	4.1	0.75
	30000	40000	0.76	0	80.3	3.4	0.69
	35000	45000	0.76	0	87.6	5.5	0.86
	30000	45000	0.76	0	83.8	4.6	0.79

UNRELIABLE AIRSPEED INDICATION TABLE
ISA, ECS ON

(Sheet 2 of 2)

	Weight at Altitude (LB)	Altitude (FT)	Climb Speed (KCAS)	FLAPS	%N_1	Pitch Attitude (°)	NAOA
Descent and Approach	32700	20000	250	0	46.6	-1.1	0.44
	32700	1000	250	0	36.0	-1.6	0.33
	28000	20000	250	0	46.6	-2.1	0.37
	28000	1000	250	0	36.0	-2.6	0.28
	32700	20000	200	10	45.6	-0.1	0.53
	32700	1000	200	10	35.0	-0.4	0.41
	28000	20000	200	10	45.6	-1.0	0.47
	28000	1000	200	10	35.0	-1.3	0.36
	32700	20000	160	20	44.7	0.8	0.59
	32700	1000	160	20	34.7	0.6	0.47
	28000	20000	160	20	44.7	-0.4	0.52
	28000	1000	160	20	34.7	-0.6	0.41
	32700	20000	140	39	44.2	-4.0	0.77
	32700	1000	140	39	34.5	-4.1	0.66
	28000	20000	140	39	44.2	-6.0	0.66
	28000	1000	140	39	34.5	-6.2	0.59

<<END>>

DUAL ADC FAILURE

ADC 1-2 Fail caution message comes on to indicate dual failure of pitot static system. Only standby instruments system is available.

NOTE

Affected systems:

- Pilot and copilots PFD with no airdata
- Autopilot
- Yaw Damper
- Rudder limiter defaults according to flaps configuration
- AUTO CPCS mode

1. Take Manual control of the aircraft
2. Fly according to ISI
3. Aircraft..... DESCEND BELOW 25,000 / 250 KCAS / 0.7M_i
4. CPCS mode ..... MAN
5. ATC ..... ADVISE (mode C inoperative)
6. Avoid icing conditions
7. Land at nearest suitable airport

<<END>>

IPC (INTEGRATED PROCESSING CABINET) 1 OR 2 OR BOTH FAILURES

IPC 1 Fail (C) or IPC 2 Fail (C) caution message indicate loss of Integrated Processing Cabinet (IPC) 1 or 2.

NOTE

This is a collector CAS message.

The following systems are inoperative:

- Indicated FMS - Navigation and CDU FMS pages
- Indicated IFIS (datalink graphical weather, echarts, emaps, terminal charts, satellite weather)
- Graphical Flight Planning (GFP) is limited to available FMS
- Onboard Maintenance System (OMS) - only when IPC 1 fails

NOTE

Expect loss of MAP as FMS fails, if FMS 3 is not available as alternate NAV source.

1. AFCS..... VERIFY REVERSION AND RE-ENGAGE

NOTE

If both IPC 1 and IPC 2 failed, and no FMS 3, then autopilot can be engaged in basic modes only.

2. NAV source ..... SELECT VALID SOURCE

If aircraft has two FMSs:

3. MAP display can be shown on one display only.

(Continued)

INTEGRATED PROCESSING CABINET (IPC) 3 FAILURE

IPC 3 Fail (C) advisory messages indicated loss of Integrated Processing Cabinet (IPC) 3.

NOTE

This CAS is a collector CAS message. > WINDSHEAR FAIL and > GROUND PROX FAIL situation awareness advisory messages come on.

The following systems are inoperative:

- Indicated TAWS (Terrain Avoidance Warning System) - ground proximity system and windshear warning module
- Indicated FMS - if available as option
- Graphical Flight Planning (GFP) is limited to available FMS

1. AFCS ..... VERIFY REVERSION AND RE-ENGAGE
2. FMS NAV source ... SET ACCORDING TO REMAINING SOURCE
3. In turbulence approach conditions - Monitor airspeed changes for any sign of windshear

<<END>>

DCU FAILURE (DATA CONCENTRATION UNIT)

DCU 1 Fail or DCU 2 Fail caution message indicates loss of two DCU channels of the same cabinet.

CAUTION

ALWAYS REFER TO CAS WINDOW AS PRIMARY INDICATION OF FAILURE.

NOTE

1. This failure results in loss of systems sensors dashes are displayed ("----") to indicate invalid data on synoptics. Brakes, electrical, bleed air, hydraulic synoptic pages will not be full.
2. Avionics functionality is degraded - only two synoptic pages may be displayed simultaneously.
3. On-side stick shaker will not operate (left stick shaker for DCU 1 failure, right stick shaker for DCU 2 failure). The opposite stick shaker will still be felt residually through the hard linkages. No stick shaker fail CAS message will be displayed.

DCU 1

If AP disengaged - select (XFR) AFCS 2 and re-engage

1. CPCS mode ..... MAN
2. Cabin ALT ..... CONTROL MANUALLY ACCORDING TO SCHEDULE
3. Transponder ..... SELECT ATC 2, 7600
4. Avoid Icing conditions

(Continued)

NOTE

Flight control synoptic page will show left gear in transition when retracted. When landing gear is extended - all three gear are displayed as down. All three green lights in landing gear panel are operating as required.

DCU 2

If AP disengaged - select (XFR) AFCS 1 and re-engage

1. Transponder..... ATC 1, 7600
2. AOP ..... SELECT 121.5
3. Advice controller of communication failure
4. Avoid Icing conditions

NOTE

Flight control synoptic page shows right main and nose gear in transition when retracted. When landing gear is extended - all three gear are displayed as down. All three green lights in landing gear panel are operating as required.

<<END>>

LOSS OF CAS WINDOW ON EICAS

Possible cause - loss of all three IPCs, or DCU dual failure.

1. Take manual control of the aircraft
2. Aircraft.....DESCEND TO 25,000 FT / 250 KCAS / 0.7M_i

NOTE

Deploying speed brakes will damp dutch roll. Counteract dutch roll using rudder or ailerons.

3. Transponder..... NO MODE C, ADVISE ATC
4. EICAS ..... ENGINE DATA BACKUP ON CDU IS AVAILABLE
5. CPCS mode .....MAN
6. Avoid icing conditions

Affected instruments:

a. FCP..... WINDOWS BLANKED; SPD BUG IS AVAILABLE

u. ISI.....OPERATING

NOTE

Switch off on side DU in order to be able to change NAV source and BRG needles using the ISI MENU button. Switch on DU again after this operation to enable ADI.

v. ADI ..... AIRDATA AND ATTITUDE VALID
w. HSI .....HDG VALID
x. Trims .....NO INDICATIONS BUT ALL THREE (3) ARE OPERABLE
y. NAV sources ..... NAV / ADF / GPS (USE CDU-PPOS page)
z. MAP display ..... INOPERATIVE

7. Land at nearest suitable airport

<<END>>

DUAL / ALL DU OVERHEAT

1. Flight director (FD) ..... COUPLE TO OPERATING SIDE
2. Affected DUs ..... TURN OFF;
   (IF TRIPLE FAILURE, LEAVE DU 1 ON UNTIL FAILS)
3. Autopilot / autothrottle ..... ENGAGE

If available DU fails:

4. Other DU ..... SWITCH ON

If all DUs fail:

5. Revert to ISI
6. Switch DU to off and then select on-side NAV source on ISI
7. Autopilot is available in basic mode. Use SYNC to change attitude

<<END>>

DUAL AHS FAILURE

AHS 1-2 Fail or AHS 1-2-3 Fail caution message indicates that all AHRS have failed.

The following systems are inoperative:

- Both PFDs
- AHS 1-2 fail
- AT 1-2 fail
- AP 1-2 fail
- Terrain fail
- WX fail
- Fuel tank DGRD
- EFIS comparator fail

If AHS 3 is available:

1. Revert to AHS 3 ..... SMC - SENSR
2. Autopilot ..... RE-ENGAGE
3. Failed AHS Cb's ..... CYCLE
4. Proceed to AHS ALIGNMENT IN FLIGHT, Page IIIA-233

If AHS 3 is not available:

5. Take manual control of the aircraft
6. Fly using ISI
7. Aircraft ..... DESCEND TO 25,000 FT / 250 KCAS / 0.7M_i
8. Use CDU for navigation
9. ATC ..... ADVISE
10. AHS 1 cb (M6, M9) and AHS 2 cb (M15, M5) ..... CYCLE
11. Proceed to AHS ALIGNMENT IN FLIGHT, Page IIIA-233

<<END>>

EQUIPMENT LOSS IN RVSM AIRSPACE

These additional requirements apply to operations in RVSM airspace:

LOSS OF ONE (1) AUTOMATED FLIGHT CONTROL SYSTEM (AFCS) IN RVSM AIRSPACE:

1. Normal flight..... CONTINUE
2. ATC .....ADVISE

LOSS OF BOTH AFCS's IN RVSM AIRSPACE:

1. ATC .....ADVISE
2. Yaw damper inoperative .... MAXIMUM 250 KCAS AND 25,000 FT
3. Mach trim inoperative..... MAXIMUM 340 KCAS /0.77M_i
4. RVSM airspace ..... .EXIT

LOSS OF ONE (1) AIR DATA SYSTEM (ADS) IN RVSM AIRSPACE:

1. Normal flight..... CONTINUE
2. ATC .....ADVISE

LOSS OF BOTH TRANSPONDERS AND/OR BOTH ADS AND/OR ALL TRANSPONDER ALTITUDE SOURCES IN RVSM AIRSPACE:

1. ATC .....ADVISE
2. RVSM airspace ..... EXIT
3. Primary altimeter / standby altimeter .....CROSS CHECK PERIODICALLY / RECORD
4. If primary altimeter and standby altimeter disagree by more than 200 ft - depart RVSM airspace

(Continued)

ALTIMETER MISCOMPARE IN RVSM AIRSPACE:

1. L PFD / R PFD / ISI altitude ..... COMPARE / RECORD DATA

If the miscompare is less than 200 ft:

2. Normal cruise ..... MAINTAIN

If the miscompare is more than 200 ft:

3. ATC ..... ADVISE
4. RVSM Airspace ..... EXIT (IF REQUIRED BY ATC)

<<END>>

DCU CHANNEL FAILURE (DATA CONCENTRATION UNIT)

DCU 1 Channel A Fail, DCU 1 Channel B Fail, DCU 2 Channel A Fail or DCU 2 Channel B Fail (Pre MOD G25-10074: Advisory; Post MOD G25-10074: Caution) advisory message comes on indicates single DCU channel failure.

NOTE

1. FD or/and RA flags may come on
2. Single DCU channel failure cause the corresponding AFCS to fail, hence an autoreversion is expected if AFCS coupled to the failed side. FD Drop AP Basic Mode caution CAS will come on when reversion occurs.
3. In high altitude/Mach regime, the Speed Command may change to 0.75M during an AFCS reversion. It is resettable.
4. When either channel A fails, Wheel Despin Fail caution CAS and BCS Maintenance REQD advisory CAS come on.
5. Expect a combination of the following advisory CAS messages:
   AP 1 Fail or AP 2 Fail
   A/T 1 Fail or A/T 2 Fail
   FCS Interface MAINT
   BAS Default Mode, R or BAS Default Mode, L
   WAI Default Mode, R or WAI Default Mode, L
   ACS Default Mode
   ENG Thrust Fault, L-R
   FDR 1 Fail
   Rudder TCM FAIL
   Check OMS
   CAS Miscompare

1. Autopilot and autothrottle .....CHECK

(Continued)

If AFCS disengaged and did not auto revert:

2. AFCS..... SWAP TO OPERATING SYSTEM (SMC - SENSR).

NOTE

FD flag should disappear and RA may remain.

3. Autopilot, autothrottle and yaw damper..... RE-ENGAGE

If Yaw Damper Off *caution message comes on - reset using YD pushbutton on AFCP.*

4. FMS NAV source..... AS REQUIRED

If ALT *flag comes on and there is a split in air data display (*Check SMC - Airdata*caution message comes on):*

5. SMC - SENSOR page..... ADC
   If failure on DCU 2 CH A - revert to ADC1
   If failure on DCU 1 CH A - revert to ADC2

<<END>>

AHS ALIGNMENT IN FLIGHT

AHS 1 Aligning, AHS 2 Aligning, AHS 1-2 Aligning, AHS 3 Aligning or AHS 2-3 Aligning advisory message is displayed. AHS flag is on top of PFD.

1. SMC - SENSR page .....SELECT CROSS SIDE AHS

NOTE

AHS flag comes on, indicating cross side is selected.

2. Compare PFD's attitude to ISI
3. Maintain straight and level flight for up to 60 seconds or until red ATT flag is cleared.

After AHS ATT MODE *advisory message comes on and CDU message* SET MAG HDG*:*

4. Perform a HDG change of 45°. Maintain straight and level flight
5. AP can be engaged in basic mode

If IRS is installed, and SET MAG HDG *message comes on CDU:*

6. FMS - INDEX - IRS CTRL... ENTER CURRENT MAGNETIC HDG (LSK6)

NOTE

Enter MAG HDG every 15 minutes, if CDU SET MAG HDG message is still in view.

When AHS ATT MODE *advisory message goes out:*

7. Continue flight with no restrictions
8. AHS ..... RE-SELECT AS REQUIRED

<<END>>

ATA 36 - PNEUMATICS

BLEED AIR SYSTEM (BAS) FAILURE

BAS Fail, L-R caution messages indicate that both bleed air systems have failed.

NOTE

Cabin altitude leak rate is about 1000 ft / min.

1. Bleed/anti ice synoptic ..... MONITOR
2. Both ENG BLEED ..... CYCLE OFF AND ON

If failure persists:

3. Both ENG BLEED ..... OFF
4. Oxygen masks ..... DON IF CAB ALT LEAKS AND APPROACHES 10,000FT
5. Exit icing conditions
6. To utilize APU bleed air - descend to 20,000 ft if possible

If below 35,000 ft - start APU:

7. APU MASTER ..... ON
8. APU START ..... PRESS

At 20,000 ft or Below:

CAUTION

DO NOT OPERATE WING ANTI ICE ON APU BLEED.

9. APU BLEED ..... ON

NOTE

APU Bleed will come on 90 seconds after APU start completed. Isolation valve will open automatically with APU bleed selection.

10. Land as soon as practicable

<<END>>

BLEED PRESSURE LOW

DUAL FAILURE

Bleed PRESS Low, L-R caution message comes on to indicate that both bleed pressures are selected and are below 5 psi for more than 10 seconds.

1. Engines thrust .....INCREASE
2. Bleed / Anti Ice Synoptic ..... MONITOR

If message persists:

3. Both ENG BLEED .....OFF
4. BLEED AIR ISOLATION ..... VERIFY CLOSED
5. Oxygen masks .....DON IF CAB ALT LEAKS AND APPROACHES 10,000 FT
6. Exit icing conditions.
7. To utilize APU bleed air - descend to 20,000 ft if possible

Below 35,000 ft:

8. APU MASTER.....ON
9. APU START .....PRESS

At 20,000 ft:

CAUTION

DO NOT OPERATE WING ANTI ICE ON APU BLEED.

10. APU BLEED .....ON

NOTE

APU bleed will come on 90 seconds after APU start completed. Isolation valve will open automatically with APU bleed selection.

11. Land as soon as practicable

<<END>>

SINGLE FAILURE

Bleed PRESS Low, L or Bleed PRESS Low, R caution message comes on to indicate that both bleed pressures are selected and are below 5 psi for more than 10 seconds.

1. Bleed/anti ice synoptic ..... MONITOR
2. Affected engine thrust ..... INCREASE

If message persists:

3. Affected ENG BLEED AIR ..... OFF
4. Both WAI ..... OFF
5. Affected WAI ..... OFF
6. ISOLATION valve ..... OPEN
7. If WAI activation is required - proceed to WING ANTI ICE OPERATION ON SINGLE SOURCE, Page IIIA-188

<<END>>

BLEED TEMPERATURE / PRESSURE HIGH

DUAL FAILURE

Bleed Air Hot, L-R or Bleed PRESS High, L-R caution messages indicate that both precooler inlets or outlets are hot or manifolds pressure is high.

CAUTION

IF DURING THE FOLLOWING PROCEDURE, IF CABIN ALTITUDE CLIMBS TO 10,000 FT OR MORE, CONTINUE TO THE HIGHER PRIORITY PROCEDURE.

1. Thrust levers ..... REDUCE TO MINIMUM FOR SAFE FLIGHT
2. Bleed/anti ice synoptic ..... MONITOR

If failure persists:

3. Both ENG BLEED ..... OFF
4. Affected WAI ..... OFF
5. BLEED AIR ISOLATION ..... VERIFY CLOSED
6. Cabin altitude ..... MONITOR
7. OXYGEN MASKS ..... DON IF CAB ALT LEAKS AND APPROACHES 10,000FT
8. Exit icing conditions.
9. To utilize APU bleed air - descend to 20,000 ft if possible

When below 35,000 ft - start APU:

10. APU MASTER ..... ON
11. APU START ..... PUSH

At 20,000 ft:

CAUTION

DO NOT OPERATE WING ANTI ICE ON APU BLEED.

(Continued)

12. APU BLEED .....ON

NOTE

APU Bleed will come on 90 seconds after APU start completed. Isolation valve will open automatically with APU bleed selection.

13. Land as soon as practicable

SINGLE FAILURE

Bleed Air Hot, L, Bleed Air Hot, R or Bleed PRESS High, L or Bleed PRESS High, R caution message indicate that the affected pre-cooler inlet or outlet is hot

1. Bleed/anti ice synoptic ..... MONITOR
2. Affected thrust lever ..... IDLE
3. Affected ENG BLEED AIR..... OFF
4. ISOLATION ..... VERIFY CLOSED
5. Both WAI ..... OFF
6. If WAI activation is required - proceed to WING ANTI ICE OPERATION ON SINGLE SOURCE, Page IIIA-188

<<END>>

ACS PACK TEMPERATURE LOW

ACS Pack TEMP Low caution message indicates that pack temperature is below 30°F for 1 minute during operation.

1. TEMP selectors..... MAX COLD
2. Both WING ANTI ICE selectors .....ON

If failure persists:

3. ALTN PRESS.....ON

NOTE

Pack valve closes automatically.

4. ECS synoptic ..... MONITOR

<<END>>

ATA 49 - APU

APU EXCEEDANCE

APU Exceedance caution message indicates that APU EGT and/or RPM exceed the limits.

NOTE

if RPM exceeds 108%, the APU performs protective shut down.

If parameters are out of limits and the APU is not required for the remainder of flight:

1. APU MASTER.....OFF

If the APU is required:

2. APU EGT and RPM .....MONITOR
3. Shut down APU as soon as practicable in flight or after landing.

<<END>>

APU FUEL SOV FAILURE

APU Fuel SOV Fail caution message indicates that the APU fuel shut-off valve has failed, or not in commanded position or valve data invalid.

During APU start:

1. APU MASTER.....CYCLE OFF/ON

If APU Fuel SOV Fail caution message clears, resume normal operation.

If failure persists - the APU is unavailable:

2. Dispatch with reference to the MEL

During APU shutdown:

1. APU MASTER.....CYCLE ON/OFF

If failure persists:

2. APU FUEL SOV cb (H14) ..... PULL
3. Log for maintenance.

<<END>>

APU FAILURES

APU Essential caution message indicates that APU is running in flight, and a fault is detected which would cause APU to shutdown if not in the ESSENTIAL mode.

APU Oil Pressure Low caution message indicates that APU is in ESSENTIAL mode and low oil pressure has been detected. In NON ESSENTIAL mode (on ground) APU will automatically shutdown.

NOTE

An APU start in the air with an APU Oil Pressure Low indication may be continued to 100% speed for a period of 30 seconds. If message is indicated beyond the period of 100% speed plus 30 seconds, it is recommended the flight crew stop APU operation and attempt an APU re-start. No damage to the APU will occur within these parameters. No special inspection criteria will be required if APU operation within these parameters are maintained.

APU Oil TEMP High caution message indicates that APU is in ESSENTIAL mode and high oil temperature has been detected. In NON ESSENTIAL mode (on ground) APU will automatically shutdown.

If APU is not required for remainder of flight or after landing:

1. APU MASTER ..... OFF

If APU is required:

2. APU EGT and RPM ..... MONITOR

NOTE

APU will continue to operate in essential mode for 15 minutes after landing.

<<END>>

ATA 52 - DOORS

MAIN ENTRY DOOR UNSAFE

Main Entry Door caution message on indicates that main entry door is not locked or a micro-switch has failed.

NOTE

In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message.

On ground:

NOTE

1. Conditions on ground - Main Entry Door (MED) is not closed/locked, one engine is running and PARK BRAKE is not set.
2. If MED Maintenance REQD advisory message is displayed, a Miscompare between MED limit switch and handle positions exists.

1. Check that both door locks and stops are in place and handle is secured
2. ACK DOOR.....PRESS

Verify that Main Entry Door status message *comes on.*

3. Dispatch airplane according to MMEL

In flight:

Below 15,000 ft:

1. Cabin Pressure Control System (CPCS) depressurizes the cabin at a rate of 1000 fpm
   .....LAND AS SOON AS PRACTICABLE

Above 15,000 ft:

If cabin pressurization is normal and door appears to be secured:

2. Flight ..... CONTINUE

If main entry door does not appear to be secure:

3. Aircraft..... LAND AT NEAREST SUITABLE AIRPORT

<<END>>

EXTERNAL BAGGAGE DOOR UNSAFE

External Baggage Door caution message on indicates that external baggage door is not locked, not secured or door micro-switch has failed. The door is accessible from baggage compartment.

NOTE

In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message.

On ground:

NOTE

External baggage door is open, one engine is running.
After message is triggered - it is latched until engines are shut down for door external inspection, or Acknowledge switch is pressed (located at the inner upper frame of main entry door).

1. Check that external baggage door locks and stops are in place and handle is secured
2. ACK DOOR.....PRESS

NOTE

Verify that External Baggage Door status message comes on.

3. Dispatch airplane according to MMEL

In flight:

Below 15,000 ft:

1. Cabin Pressure control System (CPCS) depressurizes the cabin at a rate of 1000 fpm
   .....LAND AS SOON AS PRACTICABLE

(Continued)

Above 15,000 ft:

If cabin pressurization is normal and door appears to be secured:

2. Flight ..... CONTINUE
3. Interior Baggage Door..... CLOSE

If external baggage door does not appear to be secure:

4. Aircraft..... LAND AT NEAREST SUITABLE AIRPORT

<<END>>

ATA 56 - WINDOWS

CRACKED WINDSHIELD OR SIDE WINDOW

If any ply is cracked:

1. WINDSHIELD HEAT ..... OFF
2. If left side window is cracked .....PULL CIRCUIT BREAKER (D3)
3. Cabin pressure..... REDUCE TO 7 PSI WITHIN 15 MINUTES
4. Airspeed..... 0.72 M_i / 250 KCAS (200 KCAS BELOW 8000 FT)
5. Oxygen mask .....DON (ONE PILOT IF ABOVE 10,000 FT)
6. Icing conditions ..... AVOID

<<END>>

ATA 73-80 - ENGINE

ENGINE SLOW RESPONSE

A slow engine response may indicate possible ice contamination of engine sensor probes. The FADEC has reverted to conservative acceleration/deceleration schedule to mitigate the risk of engine surge/stall and potential associated engine damage.

1. ENG ANTI ICE selector.....ON (ONE AT A TIME)

NOTE

Operation of ENG ANTI ICE above 35,000 ft decreases rate of climb to assigned flight level, if higher.

2. Engine SYNC.....OFF
3. Thrust levers .....OPERATE INDIVIDUALLY

NOTE

Monitor engine response to check if it returns to normal operation after activating engine anti-ice.

(Continued)

If engine response returns to normal:

4. Continue flight

When clear of Icing conditions:

5. Engine ANTI ICE ..... OFF

If engine response remains slow:

6. Engine Indications ..... MONITOR

NOTE

Anticipate slower than normal response to thrust lever inputs when speed control is required during approach to landing operations. Go around decision should be made early.

<<END>>

ENG FUEL TEMP LOW (L-R)

ENG Fuel TEMP Low, L-R caution message is on when both left and right engines fuel temperatures are below limit (+3°C).

WARNING

FUEL ICING AND ENGINE FLAMEOUT MAY OCCUR AT VERY LOW ENGINE FUEL TEMPERATURES.

1. Fuel synoptic ..... DISPLAY
2. Engines fuel temperatures ..... MONITOR
3. Engines parameters ..... MONITOR
4. Both FUEL STBY PUMP ..... ON
5. Thrust levers ..... ADVANCE AS PRACTICABLE TO INCREASE INDICATED MACH NUMBER (ABOVE 0.8M_i)

If failure persists:

6. Altitude ..... DESCEND TO ALTITUDE WHERE SAT IS -50°C OR WARMER
7. Maintain lower altitude and high speed until message goes out
8. Mission performance ..... RECALCULATE

If failure persists:

9. Land at nearest suitable airport

<<END>>

HOT START

Hot start is observed if ITT exceeds limitations. Engine Exceedance, L or Engine Exceedance, R warning message may appear.

NOTE

Maximum ITT during engine start:

N_2 < 40% - 650°C

N_2 > 40% - 950°C

NOTE

Start Aborted, L or Start Aborted, R caution message will be on if FADEC auto aborts engine start.

1. Affected engine FUEL CONTROL.....OFF
2. CRANK .....ON
3. Affected engine START.....PRESS

After 30 seconds:

4. CRANK .....OFF

If additional start attempt is not desired or Engine Exceedance, L *or* Engine Exceedance, R warning message *is on, consult maintenance before attempting additional start*

<<END>>

START VALVE FAILS TO CLOSE DURING ENGINE START

Starter Fail On, L or Starter Fail On, R caution message indicates that Air Turbine Starter (ATS) valve has failed to close on indicated engine.

On Ground:

1. APU BLEED AIR ..... OFF
2. EXTERNAL AIR (if applicable) ..... DISCONNECT
3. BLEED AIR ISOLATION ..... CLOSE
4. Both ENG BLEED AIR ..... OFF
5. Bleed air pressure ..... MONITOR

When bleed air pressure reaches minimum value:

6. Affected engine FUEL CONTROL ..... OFF
7. ENGINE SHUT-DOWN checklist, page IV-44 ..... PERFORM

CAUTION

CONSULT WITH MAINTENANCE BEFORE ATTEMPTING ANOTHER START SEQUENCE.

In flight:

1. Affected ENG BLEED ..... OFF
2. APU BLEED AIR (if applicable) ..... OFF
3. BLEED AIR ISOLATION ..... CLOSE

(Continued)

Did affected engine Starter Fail On *message go out?*

YES:
- NO ADDITIONAL PILOT ACTION - END OF PROCEDURE

NO:
- GO TO STEP 4 FOR AFFECTED ENGINE.

If Starter Fail On, R message is displayed – aircraft cannot be pressurized:

4. Crew / Passenger oxygen..... AS REQUIRED
5. Descent..... AS REQUIRED
6. Aircraft.....LAND AS SOON AS PRACTICABLE

If Starter Fail On, L message is displayed – alternate pressurization is available:

4. ALTN PRESS..... ON, AS REQUIRED
5. ECS Synoptic..... DISPLAY
6. Cabin and cockpit temperatures and pressurization..... MONITOR

NOTE

Cabin and cockpit temperature is controlled directly by right engine thrust setting. Temperature is not adjustable using ECS panel.

7. Aircraft.....LAND AS SOON AS PRACTICABLE

<<END>>

START VALVE FAILS TO OPEN DURING ENGINE START

1. Affected engine FUEL CONTROL.....OFF
2. APU air / external air.....VERIFY ON / CONNECTED
3. Bleed air pressure.....CHECK (32 psi minimum)

If bleed air pressure is available and adequate:

4. Affected engine FUEL CONTROL.....RUN
5. Engine START.....PRESS AGAIN

If start valve fails to open, abort engine start:

6. Affected engine FUEL CONTROL.....OFF

CAUTION

CONSULT WITH MAINTENANCE BEFORE ATTEMPTING ANOTHER START SEQUENCE.

<<END>>

ENGINE OIL PRESSURE LOW INDICATIONS WITHOUT ENGINE OIL PRESSURE LOW CAUTION MESSAGE

If only oil pressure digits are red and no ENG Oil PRESS Low, L *or* ENG Oil PRESS Low, R *warning message is on:*

NOTE

If ENG MAINT LTD message is on, a discrepancy in oil pressure sensing is suspected.

1. Oil Pressure and EICAS ..... MONITOR
2. Continue flight.

<<END>>

ENGINE VIBRATION

Engine Vibration, L, Engine Vibration, R or Engine Vibration, L-R caution message comes on when an engine has an abnormal vibration level.

CAUTION

ENGINE SHUT DOWN BASED SOLELY ON HIGH VIBRATION LEVELS, WITHOUT ABNORMAL INDICATIONS ON OTHER PRIMARY ENGINE PARAMETERS IS NOT RECOMMENDED.

NOTE

1. Failure of a fan blade in one engine will be felt by pilot as unusual vibrations and may also produce unusual fluctuations in engine instruments.
2. Vibration level may vary around the recommended airspeed and altitude. Maintain airspeed and altitude in which vibrations are minimal.

1. Affected engine thrust lever ..... RETARD UNTIL INDICATIONS RETURN TO NORMAL LEVEL
2. If in icing conditions..... INCREASE THRUST

(Continued)

If severe vibration persists:

3. Land at nearest suitable airport
4. Affected engine FUEL CONTROL..... OFF
5. According to aircraft altitude:
   If above 30000 ft -
   Decelerate to 200 KCAS at constant altitude; continue constant speed descent to 30,000 ft then maintain 30000 ft / 0.55M_i
   If below 30,000 ft -
   Decelerate and maintain 0.55 M_i
   If below 20,000ft -
   Decelerate and maintain 0.50 M_i
6. Inoperative engine GEN..... OFF
7. Inoperative ENG BLEED..... OFF
8. Affected HYDRAULIC EMP ..... VERIFY ON
9. Affected engine FUEL STBY PUMP..... OFF
10. TCAS ..... TA ONLY

NOTE

The APU may be used as an alternate source of electrical power, if desired. See APU START (ON GROUND), Page IV-10.

WARNING

DO NOT RESTART THE AFFECTED ENGINE.

(Continued)

When further descent is required:

11. Descend while maintaining 0.55 M_i until reaching 20,000 ft;
    at 20,000 ft decelerate to 0.50 M_i;
    descend while maintaining 0.50 M_i until reaching 10,000 ft

CAUTION

HIGH VIBRATIONS ARE EXPECTED DURING DECELERATION. DECELERATION MUST BE PERFORMED AS FAST AS POSSIBLE.

12. When necessary, descend to 5000 ft or below at 250-270 KCAS

When descent to approach is required:

13. Airspeed ..... REDUCE TO 175 KCAS AS QUICKLY AS POSSIBLE; USE SPEED BRAKES AS REQUIRED
14. Flaps ..... .20°
15. Landing gear ..... DOWN
16. NWS ..... INOP

At final approach leg:

17. REDUCE TO V_{REF} + 5 KT AS QUICKLY AS POSSIBLE
18. Perform SINGLE-ENGINE APPROACH AND LANDING, Before landing:, page II-67

<<END>>

ENGINE SURGE OR COMPRESSOR STALL

Conditions and Indications

One or more of the following occur:

- Engine ITT changes rapidly or erratically without corresponding change in Thrust Lever position, including rapid increases in ITT that approach or exceed limits
- Engine emits unusual noises, possibly with a few “popping” sounds
- A sudden change occurs in engine vibration levels which can possibly be felt in the airframe a momentary Engine Vibration, L or Engine Vibration, R CAS message.
- Engine responds only to Thrust Lever retard, engine thrust cannot be increased or increases in engine thrust occur more slowly than expected
- Flames are reported coming from engine exhaust or inlet with no associated fire system warning.

Corrective Actions

1. Affected engine Thrust Lever.....IDENTIFY AND CONFIRM
2. Affected engine Thrust Lever..... REDUCE THRUST UNTIL ENGINE PARAMETERS ARE WITHIN LIMITS, OR THRUST LEVER IS AT IDLE

NOTE

Engine FADEC provides protection for surge and compressor stall events. Engine response to thrust lever advancement is reduced for several seconds, but reductions in thrust are not changed. The engine should respond to thrust lever inputs normally within several seconds, once the surge or compressor stall clears. Engine response and performance after a surge or compressor stall depends on the amount of damage that occurred within the engine during the event.

(Continued)

3. Engine EVENT pushbutton .....PRESS
4. Affected engine Parameters
   (N1, N2, ITT, VIB and Oil Pressure) ..... MONITOR

After 60 seconds from event start:

5. Are affected engine parameters CONTROLLABLE and STABLE within limits, and does engine OPERATE SMOOTHLY at IDLE OR HIGHER thrust setting:?
   YES: .....Affected engineSHUTDOWN
   ..... (Go to ENGINE SHUTDOWN IN FLIGHT, Page II-57)
   NO: .....Go to Step 6.

6. Are affected engine parameters CONTROLLABLE and STABLE within limits, and does engine OPERATE SMOOTHLY at IDLE OR HIGHER thrust setting:
   YES:
   A. Affected Thrust Lever....ADVANCE SLOWLY AS REQUIRED
   B. If engine acceleration is NORMAL..... OPERATE ENGINE NORMALLY OR AT REDUCED THRUST SETTING THAT IS FREE OF SURGE OR STALL

   CAUTION

   DO NOT CONTINUE TO ADVANCE THRUST LEVER IF INDICATIONS OF SURGE OR COMPRESSOR STALL RETURN. GO TO ENGINE SHUTDOWN IN FLIGHT, Page II-57

   C. Land as soon as practicable
   D. Event.....LOG FOR MAINTENANCE

<<END>>

NO:
A. If engine acceleration is ABNORMAL ...: THRUST LEVER AT IDLE

(Continued)

B. LAND AT NEAREST SUITABLE AIRPORT

NOTE

It is recommended to leave affected engine operating at idle, if possible, to provide electrical and hydraulic power and motive flow for fuel balancing. However, the affected engine may require shutdown if engine parameters are exceeded. The following steps prepare for such an occurrence or minimal thrust available from the engine.

C. APU .....CONSIDER START

NOTE

The APU may be used as an alternate source of electrical power, if desired. See APU START (IN FLIGHT), Page IV-12.

D. TCAS ..... TA ONLY
E. FUEL BALANCE ..... MONITOR
F. Perform SINGLE-ENGINE APPROACH AND LANDING, Page II-66.

<<END>>

THIS PAGE
INTENTIONALLY
LEFT BLANK

EICAS ADVISORY MESSAGES

Following is a ready-reference guide which briefly outlines the message meaning and action to be taken when a message comes on. It also refers to subject, section and page where more detailed information and procedures are found.

Procedures are grouped by actions. There can be separate procedures for Left (L) system failure, Right (R) system failure and both (L-R) systems failure, or one procedure for both left or right or both system failure as follows:
L/R - (L) or (R)
L-R - (L and R)
L/R/L-R - (L) or (R) or (L and R)

SA (SITUATIONAL AWARENESS) CAS MESSAGE

When a collector CAS message come on, most of the failures that are caused or derived from this failure are masked. Failures that are regarded as important for crew situational awareness will be marked with a caret (**>**) on its left and have no procedure associated with it. These SA CAS messages are intended to report to the crew that the collector failure causes a degradation in: flight envelope, pressurization control, environmental control, flight and ground control, and loss of annunciation or alert capabilities.

NOTE

1. The advisory CAS messages flash for 5 seconds when first displayed and then become steady.
2. When any message comes on, check appropriate switches and circuit breakers.
3. All advisory messages are automatically inhibited from TLA above 70% N_1. The inhibit ends when the aircraft is at more than 400 ft or 30 seconds above the ground.
4. Log for maintenance action, any advisory CAS message that has been displayed during flight, when not triggered by pilot action.

ADVISORY MESSAGES (CYAN)

(Sheet 1 of 40)

Message	Cause(s)	Corrective Action
A/T 1 Fail A/T 2 Fail	Autothrottle failed	Verify A/T reversion (cross side A/T green annunciation on PFD)
AC Inverter Fail	AC inverter has failed.	Log for maintenance.
ACP 1 Fail ACP 2 Fail	Audio Control Panel (ACP) failed	Log for maintenance. Use ACP 3 if available
ACP 3 Fail ACP 1-3 Fail ACP 2-3 Fail	Audio Control Panel (ACP) failed	Log for maintenance
ACS Default Mode	Air Conditioning System fault(s) detected. Air Conditioning System (ACS) has reverted to default mode due to airflow measurement fault. Flow is controlled per default altitude value (30,000 ft)	Log for maintenance
ACS Maintenance REQD	ACS has fault(s) detected	Log for maintenance
ADF 1 Fail ADF 2 Fail ADF 1-2 Fail	Indicated directional finder (ADF) failed. (Dual installation)	Log for maintenance
ADF Fail	Automatic directional finder (ADF) failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 2 of 40)

Message	Cause(s)	Corrective Action
ADM Complete	Autopilot has captured 15,000 ft target, 225 KIAS target, and left orbit completing the Automatic Descent Mode (ADM) profile	1. Autopilot - DISCONNECT NOTE: Message will clear 2. Autopilot - AS DESIRED
AFT EMER LTG BATT On	Pre MOD G25-10074: Aft emergency lighting battery is on OR the battery is not being charged	Verify proper position of EMER LTS switches and check R EMER circuit breaker (C11) **NOTE** Message will display when there is no power to the Distributions Buses even when the EMER LTG BATT is not On and not discharging.
AFT EQUIP Fan Fail	Aft radio rack equipment cooling fan failed	Log for maintenance
AFT Fuel QTY DGRAD	A probe in the indicated fuel tank failed and the fuel quantity data is degraded	1. Fuel Synoptic - DISPLAY 2. Fuel parameters - MONITOR

ADVISORY MESSAGES (CYAN)

(Sheet 3 of 40)

Message	Cause(s)	Corrective Action
AHS 1 Fail AHS 2 Fail AHS 3 Fail AHS Fail	Attitude Heading Source (AHS) or Inertial Reference System (IRS) critical failure has occurred	NOTE: Auto reversion to cross side sensor expected. 1. SMC - SENSOR - Verify source 2. Circuit breaker - CYCLE: For AHS 1 - M9 (AHS1B), M6 (AHS1A) For AHS 2 - M15 (AHS2B) M5 (AHS2A) For AHS 3 - M14 (AHS3B), M4 (AHS3A) 3. When AHS 1 Aligning / AHS 2 Aligning/ AHS 3 Aligning advisory message comes on, continue with AHS ALIGNMENT IN FLIGHT, page IIIA-233

ADVISORY MESSAGES (CYAN)

(Sheet 4 of 40)

Message	Cause(s)	Corrective Action
AHS 1 SEC PWR Fail AHS 2 SEC PWR Fail AHS 3 SEC PWR Fail AHS 1-2 SEC PWR Fail AHS 1-3 SEC PWR Fail AHS 2-3 SEC PWR Fail AHS SEC Power Fail	Secondary power is not available to the AHS or IRS	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 5 of 40)

Message	Cause(s)	Corrective Action
AHS 1 Secondary Power AHS 2 Secondary Power AHS 3 Secondary Power AHS 1-2 Secondary PWR AHS 1-3 Secondary PWR AHS 2-3 Secondary PWR AHS 1-2-3 SEC Power	Attitude Heading Source (AHS) or Inertial Reference System (IRS) is operating on secondary power.	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 6 of 40)

Message	Cause(s)	Corrective Action
AHS 1 ATT Mode AHS 2 ATT Mode AHS 3 ATT Mode AHS 1-2 ATT Mode AHS 1-3 ATT Mode AHS 2-3 ATT Mode AHS 1-2-3 ATT Mode	AHS is operating in Attitude mode	AHS provides minimum attitude reference. If AHS 1 Aligning / AHS 2 Aligning/ AHS 3 Aligning advisory message comes on as well, See AHS ALIGNMENT IN FLIGHT, page IIIA-233
AHS 1 POS Entry AHS 2 POS Entry AHS 3 POS Entry AHS 1-2 POS Entry AHS 1-3 POS Entry AHS 2-3 POS Entry AHS 1-2-3 POS Entry	AHS or IRS has completed its alignment phase, but has did not receive an initial position either from GPS, FMS, or AHS, or IRS failed an alignment test possibly due to an invalid initialization position entry	1. Enter position in CDU - INDEX - POS INIT 2. Verify FMS are in SYNC mode

ADVISORY MESSAGES (CYAN)

(Sheet 7 of 40)

Message	Cause(s)	Corrective Action
AHS 1 Aligning AHS 2 Aligning AHS 1-2-3 Aligning AHS 1-2 Aligning AHS 3 Aligning AHS 2-3 Aligning AHS 1-3 Aligning	AHS or IRS has not yet completed its alignment phase during stationary alignment, or AHS or IRS power was momentarily interrupted resulting in alignment in motion during flight	On ground: Do not taxi. NOTE: Wait until the stationary alignment is completed before starting taxi or departure. In flight only, see AHS ALIGNMENT IN FLIGHT, page IIIA-233
AOA Heat Fail, L AOA Heat Fail, R AOA Heat Fail, L-R	AOA sensor vane heater failed	See PROBE HEAT FAILURE, Page IIIA-191
AOA Probe Fail, L AOA Probe Fail, R	AOA probe failed in flight	NOTE: Failed AOA display is generated by the operational AOA. Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 8 of 40)

Message	Cause(s)	Corrective Action
AP 1 Fail AP 2 Fail	Autopilot (AP) system failed	*On Ground:* NOTE: AFCS does not auto revert on ground. 1. Switch AFCS to operating system. (SMC-SNSR-AFCS) *In Air:* NOTE: AFCS auto reverts to operating side. 2. Log for maintenance
AP CTRL SW Stuck	Autopilot ON/OFF switch is stuck	NOTE: If AP is not engaged and AP CTRL switch is stuck in off OFF position, AP is unavailable. *To disconnect AP, use the following options:* 1. AP DISC switch on yoke 2. AFCS disconnect bar 3. ALTN STAB - ON

ADVISORY MESSAGES (CYAN)

(Sheet 9 of 40)

Message	Cause(s)	Corrective Action
AP Engage Inhibit	Attempt to engage autopilot under any of following conditions: Autopilot disconnect button active; TOGA switch active; Stick shaker is active; Sync switch is active; Trim up / down switch active; ALTN STAB selected	*Unless in ALTN STAB mode:* Autopilot - RE-ENGAGE
AP SRVO OVRD Fail	The autopilot force override system has failed or has been disabled.	Revert to opposite AFCS system. NOTE: Force override AP disconnect will not occur, in case of dual Hydraulic Failure.
APM 1 Fail APM 2 Fail APM 1-2 Fail	Indicated APM (Aircraft Personality Module) failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 10 of 40)

Message	Cause(s)	Corrective Action
APU Door Fail Close	APU door failed to open and MASTER pushbutton is ON	1. APU MASTER - CYCLE OFF THEN ON *If message clears:* 2. Continue normal operation *If failure persists:* 3. APU MASTER - OFF NOTE: In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message
APU Fire Loop A Fail	APU fire detector failed	Log for maintenance
APU Fire Loop B Fail	APU fire detector failed	Log for maintenance
APU Fuel Valve Fault	APU fuel solenoid fault (fuel solenoid in transit or open) detected during APU shutdown	Maintenance action is required
APU Maintenance REQD	APU ECU detected faults	Log for maintenance
APU Master On	APU MASTER is selected ON and APU is off for more then 5 minutes	APU MASTER - AS REQUIRED

ADVISORY MESSAGES (CYAN)

(Sheet 11 of 40)

Message	Cause(s)	Corrective Action
APU Oil Level Low	APU oil level low	Service APU oil
APU Ready	APU ready for start attempt	Start APU if required
ATC 1 Fail	Indicated transponder has failed but is not selected.	Log for maintenance.
ATC 2 Fail	Indicated transponder has failed but is not selected.	Log for maintenance.
Autobrake Disarmed	Autobrake selector knob selected to OFF position during landing / taxi, or, during landing when auto brakes were armed and pedal position exceeded 25% or throttle advanced beyond idle or when landing gear is retracted after takeoff with RTO set for takeoff	Autobrake - AS REQUIRED
Avionics CONFIG DGRAD	Only one APM detected and being used by the system	Log for maintenance
BAS Default Mode, L BAS Default Mode, R BAS Default Mode, L-R	Indicated Bleed Air System (BAS) has reverted to default bleed selection (high stage valve)	Bleed/anti-ice synoptic page - MONITOR

ADVISORY MESSAGES (CYAN)

(Sheet 12 of 40)

Message	Cause(s)	Corrective Action
BAS MAINT REQD, L BAS MAINT REQD, R BAS MAINT REQD, L-R	Bleed Air System (BAS) maintenance is required	Log for maintenance
BATT Feeder Fail, L BATT Feeder Fail, R BATT Feeder Fail, L-R	Battery switch selected on and indicated battery line contactor open	1. Electrical synoptic page - MONITOR NOTE: If R FEEDER fails (amber line on synoptic) - attempt APU Start only under emergency condition or after landing. NOTE: In dual failure - battery power is available for emergency flight only
BCS Maintenance REQD	Indicated Brake Control System (BCS) maintenance required	Log for maintenance
Bleed Configuration	On ground, APU air is ON with engines operating and bleed air pushbuttons are OFF	On ground, APU air is ON and engine bleed air pushbuttons are selected OFF.
Cabin Call	Toggled by cabin / galley / interphone or telephone	Select CAB on ACP. Use PTT to call cabin

ADVISORY MESSAGES (CYAN)

(Sheet 13 of 40)

Message	Cause(s)	Corrective Action
CAS Miscompare	CAS mismatch between DCU channels (lasting for more than 20 seconds)	Monitor aircraft parameters and systems
CCD Fail, L CCD Fail, R CCD Fail, L-R	Cursor Control Device (CCD) failed	Use the SMC as appropriate
Check OMS	Faults are active and recorded by the OMS. Message is active only prior to first taxi with parking brake on, and after landing when engine are off.	Log for maintenance
Checklist Mismatch	Different checklist installed in DCU 1 and DCU 2	Do not use Electronic Checklist (ECL)
Cities Fail	Cities overlay is not available	Use other means of information
Clock Alarm Expired, L Clock Alarm Expired, R	DCP alarm clock timer has expired	Set as required
CPCS LFE Fail	FMS and SMC inputs to CPCS are invalid	1. FMS Flight Plan - CHECK VALID DEST *If required:* 2. Select LFE manually through SMC (SMC UTIL – CPCS)

ADVISORY MESSAGES (CYAN)

(Sheet 14 of 40)

Message	Cause(s)	Corrective Action
CPCS LFE Miscompare	Difference between selected LFE and the computed LFE exceeds 100 ft	Select LFE manually - SMC UTIL - CPCS
CPCS Maintenance REQD	CPCS maintenance is required	Log for maintenance
CPCS Monitor Fail	Malfunction in cabin pressure controller monitor channel	1. BARO setting - CHECK 2. Monitor cabin altitude
CPCS Warning Set High	Cabin pressure low warning was set to 14,750 ft instead of 10,000 ft	Check ORIGIN and DEST in flight plan
CTR Fuel QTY DGRAD	A probe in the indicated fuel tank failed and the fuel quantity in that tank is degraded	1. Fuel Synoptic - DISPLAY 2. Fuel parameters - MONITOR
CTRLD Airspace Fail	Controlled airspace overlay is not available	Use other means of information
CVR 1-2 Fail CVR 1 Fail CVR 2 Fail	Cockpit Voice Recorder (CVR) failed	Log for maintenance
Datalink 1-2 REC Fail Datalink 1 REC Fail Datalink 2 REC Fail	Affected CVR Datalink function has failed	1. Check RECORDER and RIU circuit breakers 2. Log for Maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 15 of 40)

Message	Cause(s)	Corrective Action
Datalink COM In Voice	The datalink system does not have a Very High Frequency (VHF) radio in DATA mode	Select one of the VHF COM radios to DATA
Datalink MSG Received	The datalink system has received an ACARS message	Review datalink message
Datalink SELCAL	Datalink VHF radio has incoming selective call	Check messages
Dataload Error	Attempted dataload failed	Log for maintenance
Dataload In Progress	Displayed when a dataload is in progress	No action required
DCU 1 Channel A Fail	Pre MOD G25-10074: DCU 1 Channel A failed	See DCU CHANNEL FAILURE (DATA CONCENTRATION UNIT). page IIIA-231
DCU 1 Channel B Fail	Pre MOD G25-10074: DCU 1 Channel B failed	See DCU CHANNEL FAILURE (DATA CONCENTRATION UNIT). page IIIA-231
DCU 1 Fan Fail DCU 1-2 Fan Fail DCU 2 Fan Fail	Fan on indicated DCU failed	Log for maintenance
DCU 2 Channel A Fail	Pre MOD G25-10074: DCU 2 Channel A failed	See DCU CHANNEL FAILURE (DATA CONCENTRATION UNIT). page IIIA-231

ADVISORY MESSAGES (CYAN)

(Sheet 16 of 40)

Message	Cause(s)	Corrective Action
DCU 2 Channel B Fail	Pre MOD G25-10074: DCU 2 Channel B failed	See DCU CHANNEL FAILURE (DATA CONCENTRATION UNIT). page IIIA-231
DL GWX Fail	Graphical weather system failed	Log for maintenance
DME 1 Fail DME 2 Fail DME 1-2 Fail	Indicated Distance Measuring Equipment (DME) failed	NAV position accuracy - MONITOR
DU 1 Fail DU 2 Fail DU 3 Fail	Indicated DU failed	1. Affected DU switch - RESET (OFF THEN ON) **NOTE:** SMC MEM function is not operative. If MEM is selected, "Function not Available" message will be displayed on the SMC.

ADVISORY MESSAGES (CYAN)

(Sheet 17 of 40)

Message	Cause(s)	Corrective Action
DU 1 Fan Fail DU 2 Fan Fail DU 3 Fan Fail DU 1-2 Fan Fail DU 1-3 Fan Fail DU 2-3 Fan Fail DU 1-2-3 Fan Fail	Fan on indicated DU failed	Log for maintenance
Dual Aural Alert Fail	Radio Interface Unit (RIU) conflict	1. RIU 2A CB (L11) - CYCLE *If failure persists and sound quality is degraded:* 2. Both RIU 2 cb's (L11, L12) - PULL 3. See RIU (RADIO INTERFACE UNIT) FAILURES, Page IIIA-96
ECHARTS Fail	ECHARTS overlay is not available	Use other means of information
EFIS Comparator Fail	EFIS comparator system malfunctions	NOTE: Potential loss of crosstalk between the displays. 1. Monitor instruments for difference
Elevator HOPS Fail	In flight only, hard over protection system failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 18 of 40)

Message	Cause(s)	Corrective Action
Elevator MAINT REQD	Elevator maintenance required	Log for maintenance
EMAPS Fail (C)	Entire EMAPS overlays are not available: TFR, SUA, CTRLD Airspace, Political Boundaries, Obstacles and Cities	Use other means of information
ENG Fuel Filter, L ENG Fuel Filter, R	Engine fuel filter bypassed (contamination)	Monitor affected engine and fuel parameters
ENG Fuel TEMP Low, L ENG Fuel TEMP Low, R	Fuel temperature dropped below acceptable value. Fuel icing may occur	1. Descend and increase airspeed 2. Monitor engine and fuel temperatures
ENG Oil Chip, L ENG Oil Chip, R ENG Oil Chip, L-R	Metal debris detected in indicated engine(s) lubrication systems	1. Monitor engine parameters. 2. Land at nearest suitable airport
ENG Oil Bypass, L ENG Oil Bypass, R ENG Oil Bypass, L-R	Oil filter bypass	1. Log for maintenance *If failure is for both L and R oil systems:* 2. Land at nearest suitable airport

ADVISORY MESSAGES (CYAN)

(Sheet 19 of 40)

Message	Cause(s)	Corrective Action
ENG Thrust Fault, L ENG Thrust Fault, R ENG Thrust Fault, L-R	FADEC failure resulting in minor changes in thrust	Monitor engine parameters.
ENG Vibration Fail, L ENG Vibration Fail, R ENG VIB Fail, L-R	Engine vibrations indicator failed	1. Log for maintenance. 2. If accompanied by abnormal engine vibrations and abnormal engine indication, See ENGINE VIBRATION, page IIIA-256
Engine Fault, L Engine Fault, R Engine Fault, L-R	In-flight only message. Engine control system functional failure which may prevent dispatch after next landing and has no impact on continued safe flight	Log for maintenance
Engine IGN Fault, L Engine IGN Fault, R Engine IGN Fault, L-R	Engine has no Ignition system redundancy	*If Icing conditions, Turbulence, and/or heavy rain are expected:* 1. CONT IGN - ON

ADVISORY MESSAGES (CYAN)

(Sheet 20 of 40)

Message	Cause(s)	Corrective Action
Engine MAINT LTD, L Engine MAINT LTD, R Engine MAINT LTD, L-R	Engine has minor fault (not affecting engine performance).	See MMEL
ENG Minor Fault, L ENG Minor Fault, R ENG Minor Fault, L-R	Indicated FADEC failed in such way that a short term dispatch situation exists	Log for maintenance
Engine SYNC Fail	Engines synchronization (SYNC) function failed (N_1 or N_2)	Log for maintenance
EPS MAINT REQD	Electrical power system maintenance required	Log for maintenance
Exceedance Record	OMS has automatically recorded an exceedance	Log for maintenance
EXT Power Fail	External DC power source available and EXT PWR pushbutton selected ON but contactor is open	ELECTRICAL RESET - PUSH AND HOLD FOR 10 SECONDS

ADVISORY MESSAGES (CYAN)

(Sheet 21 of 40)

Message	Cause(s)	Corrective Action
EXT Power Overload	External DC power load greater than 100%	Reduce electrical load NOTE: After 60 seconds of overload of more than 400A a line contactor will open. The message comes on after 30 seconds of overload
External Baggage Door	On ground only – External baggage door is not locked and both engines are off, or PARK brake is on with engines running	External baggage door - CLOSE
FADEC Download	A download of the FADEC maintenance data is recommended.	Log for maintenance
FCP A Fail	FCP channel A failed	Log for maintenance
FCP B Fail	FCP channel B failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 22 of 40)

Message	Cause(s)	Corrective Action
FCS Interface MAINT	Altitude difference between pilot and co-pilot PFD greater than 1000 ft. OR DCU ARINC 429 I/O failure detected. Possible RSE failure, OR Possible TQA RVDT and idle discrete mismatch. (will latch if triggered in flight)	*On ground:* 1. Set Pilot and Co-pilot altimeters to the same value. If message does not clear: 2. Aircraft - Power off (60 seconds) and on 3. If failure reoccurs - log for maintenance *In flight:* 1. Continue flight **NOTE**: Aircraft electrical reset after landing clears latched failure.
FDR 1 Fail FDR 2 Fail FDR 1-2 Fail	Indicated Flight Data Recorder (FDR) failed	Log for maintenance
FDR Interface MAINT	Displayed when either Co-Pilot Wheel sensor failure, Pilot Column sensor failure, Co-Pilot Column sensor failure	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 23 of 40)

Message	Cause(s)	Corrective Action
FIRE BTL 1 Discharge FIRE BTL 2 Discharge	Fire bottle has been discharged (in flight only)	1. Log for maintenance 2. If Bottle 2 discharged, consider APU operation in emergency only
Fire Loop A Fail, L Fire Loop A Fail, R	Indicated engine fire detection loop A failed	Log for maintenance
Fire Loop B Fail, L Fire Loop B Fail, R	Indicated engine fire detection loop B failed	Log for maintenance
Fire SYS CH A Fail	In flight only: Loss of FPS Channel A. No ARINC output	1. Fire system test - PERFORM *If fire handles and fuel control switch do not illuminate - CH B failed as well:* 2. Land at the nearest suitable airport NOTE: FIRE and OVERHEAT warning or caution CAS messages will not come on (fire handles and fuel cutoff switches will illuminate)

ADVISORY MESSAGES (CYAN)

(Sheet 24 of 40)

Message	Cause(s)	Corrective Action
Fire SYS CH B Fail	In flight only: Loss of FPS Channel B. No fire discrete available, No single loop B failure detection	Log for maintenance NOTE: FIRE and OVERHEAT warning or caution CAS messages will come on (fire handles and fuel cutoff switches will not illuminate)
Flap Maintenance REQD	Flaps maintenance is required	Log for maintenance
FMS 1 Fail FMS 2 Fail FMS 3 Fail FMS 1-2 Fail FMS 1-3 Fail FMS 2-3 Fail FMS 1-2-3 Fail	Navigation computer failed	1. NAV source - SELECT NOTE: Performing WAAS LPV approach is not authorized with only one FMS operating or selected as NAV Source.
FPS Maintenance REQD	Fire protection system maintenance required	Log for maintenance
FQMC Channel Fail, L FQMC Channel Fail, R	Fuel Quantity Measurement Computer (FQMC) channel failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 25 of 40)

Message	Cause(s)	Corrective Action
FQMS Maintenance REQD	Fuel Quantity Measurement System (FQMS) maintenance required	Log for maintenance
Fuel QTY COMP Fail	Fuel quantity compensation is failed (both compensators)	Log for maintenance
FWD EMER LTG BATT On	Pre MOD G25-10074: Forward emergency lighting battery is on OR the battery is not being charged.	Verify proper position of EMER LTS switches and check L EMER circuit breaker (C1) **NOTE** Message will display when there is no power to the Distribution Buses even when the EMER LTG BATT is not On and not discharging.
FWD EQUIP Fan Fail, R	Indicated forward radio rack equipment cooling fan failure	1. CKPT TEMP CONTROL - MAN 2. CKPT TEMP - FULL COLD
FWD Fuel QTY DGRAD	A probe in forward fuel tank failed and the fuel quantity data is degraded	1. Fuel synoptic - DISPLAY 2. Monitor fuel quantities and transfer
Gear Bottle PRESS Low	Emergency landing gear extension bottle pressure is less than 2150 psi in flight	Monitor gear bottle pressure on HYD/ground services synoptic page

ADVISORY MESSAGES (CYAN)

(Sheet 26 of 40)

Message	Cause(s)	Corrective Action
GFCI Fault	Alternating current power (AC PWR) inverter Ground Fault Control Interrupter has been tripped	1. 60 HZ - OFF Do not attempt GFCI reset unless reason for the trip is identified and removed. 2. Log for maintenance
GPS 1 Fail GPS 2 Fail	Indicated Global Positioning Satellite (GPS) system failed	1. Circuit breaker M17 or M18 - CYCLE 2. Consider how failure affects mission
Ground PROX Fail	GPWS function failed	NOTE: Radio altimeter-based alerts not functional (Gear Not Down, Flaps, GS)
HF 1 Fail HF 2 Fail HF 1-2 Fail	High Frequency (HF) radio(s) failed	Log for maintenance
HF 1 SELCAL HF 2 SELCAL HF 1-2 SELCAL	High Frequency (HF) radio(s) incoming Selective Call (SELCAL) message	Call controller on HF COM
HYD Filter MAINT, L HYD Filter MAINT, R HYD Filter MAINT, L-R	Hydraulic filter partially clogged	*On ground:* Refer to MMEL *In flight:* Continue flight
HYD Maintenance REQD	Hydraulic system maintenance required	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 27 of 40)

Message	Cause(s)	Corrective Action
HYD TEMP SEN Fail, L HYD TEMP SEN Fail, R HYD TEMP SEN Fail, L-R	Indicated hydraulic system(s) temperature sensor(s) failed	*On ground:* Log for maintenance *In flight:* Continue flight
Ice Detected, L Ice Detected, R Ice Detected, L-R	Post MOD G25-10074: Ice detected by indicated ice detector while both EAI and WAI are operating and engines and wings are protected.	No action required
IMS Fail	Information Management System (IMS) failed Post MOD G25-10074: On ground only.	Log for maintenance
INBD Brake Degrade, L INBD Brake Degrade, R	Indicated Wheel Speed Transducer (WST) failed	See SINGLE WHEEL SPEED TRANSDUCER (WST) FAILURE, Page IIIA-201
INBD Roll Assist Fail	Control wheel sensors have failed and FCECU 2 is not receiving valid roll assist command	*On ground:* Do not dispatch. *In flight:* 1. ROLL ASSIST - OFF 2. Maximum Crosswind - 7 kt

ADVISORY MESSAGES (CYAN)

(Sheet 28 of 40)

Message	Cause(s)	Corrective Action
Internal Baggage Door	Internal baggage compartment door is open between 24,500 ft and 39,500 ft, or, on ground and one engine is running and PARK brake is on	If message is displayed with door closed, log for maintenance.
IPC 1 Fan Fail IPC 2 Fan Fail IPC 3 Fan Fail IPC 1-2 Fan Fail IPC 1-3 Fan Fail IPC 2-3 Fan Fail IPC 1-2-3 Fan Fail	Indicated IPC fan failed	30 minutes to operate the IPC provided aircraft reaches 20,000 ft within 30 minutes
IPC 3 Fail (C)	Indicated IPC channel failed	See INTEGRATED PROCESSING CABINET (IPC) 3 FAILURE, page IIIA-223
Lavatory Call	Toggled by lavatory call	Answer call

ADVISORY MESSAGES (CYAN)

(Sheet 29 of 40)

Message	Cause(s)	Corrective Action
Lavatory Rinse Open	Toilet Assembly Rinse Valve fails to reach closed position.	***In flight:*** 1. Log for maintenance ***On ground:*** 1. Manual shutoff valve - CLOSE 2. Water / Waste System Control and Indication Panel (WWCIP) - PERFORM SYSTEM RESET according to instructions on Page 4 of the panel. ***If message does not clear:*** See MMEL, Section 2
LG Maintenance REQD	Maintenance required for Radio Altimeter or for LG LRUs minor fault (single WOW, or lock indication that does not affect system or tire overspeed) **NOTE:** If Flight Control Synoptic indicates G with an amber background on all three WOW indications, check the PFD for Radar Altimeter read out. If there is no Radar Altimeter value displayed, suspect cause is RA error.	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 30 of 40)

Message	Cause(s)	Corrective Action
Mach-hold Disengaged	Mach hold not available	Mach hold mode - RE-ENGAGE
Main Entry Door	Aircraft on ground and door not closed/locked and engines off, or PARK BRAKE ON with engines running	CAUTION: DO NOT TAXI OR TOW AIRCRAFT. NOTE: In case of a miscompare between the CAS message and the synoptic page, act according to the CAS message 1. MED - AS REQUIRED *If door closed:* 2. MED - INSPECT *If failure persists:* 3. See MAIN ENTRY DOOR UNSAFE, Page IIIA-243
MED Maintenance REQD	Miscomparison between MED limit switch and handle positions	1. Inspect door before departure 2. Refer to MMEL
NAV 1 Fail NAV 2 Fail NAV 3 Fail NAV 1-2 Fail NAV 1-3 Fail NAV 2-3 Fail NAV 1-2-3 Fail	VHF navigation radio(s) failed	1. Use other navigation sensors 2. Disable indicated VOR/DME in FMS

ADVISORY MESSAGES (CYAN)

(Sheet 31 of 40)

Message	Cause(s)	Corrective Action
New Database AVAIL	New databases are available for load, on ground only	Log for maintenance
No DU X / FMS Y GFP	No interface between indicated MAP and the indicated FMS for graphical flight planning. X Y range is between 1 and 3	Log for maintenance
Nose Fan Fail, L Nose Fan Fail, R Nose Fan Fail, L-R	Nose equipment cooling fan failure	Log for maintenance
Nose Temperature High	Nose compartment temperature exceeds 140° F	*On Ground:* 1. Check nose blowers 2. Climb to 20,000 ft within 30 minutes of message appearance *If above 20,000 ft:* 1. Select off (use cb's) unnecessary electronic / avionics equipment in nose compartment: WX, DU2, IPC 3, NAV 2,3, ADF, GPS2, DME 2. 2. Land at nearest suitable airport

ADVISORY MESSAGES (CYAN)

(Sheet 32 of 40)

Message	Cause(s)	Corrective Action
Obstacle Fail	Obstacle overlay is not available	1. Use other means of information 2. Log for maintenance
OMS Fail	OMS failed	Log for maintenance
OTBD Roll Assist Fail	Control wheel sensors failed and FCECU 2 is not receiving valid roll assist command	Log for maintenance
OUTBD Brake Degrade, L OUTBD Brake Degrade, R	Indicated Wheel Speed Transducer (WST) failed	See SINGLE WHEEL SPEED TRANSDUCER (WST) FAILURE, Page IIIA-201
PC Load Letter	Printer out of paper	Load paper
POL Boundaries Fail	Political boundaries overlay is not available	Use other means of information
Printer Fault	Printer fault detected	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 33 of 40)

Message	Cause(s)	Corrective Action
RAD ALT 1 Fail RAD ALT 2 Fail RAD ALT 1-2 Fail	Indicated radar altimeter has failed (dual installation)	1. Revert to operating RADALT. (SMC - SENSOR - RAD ALT) *If unable to revert system:* 2. Verify Flight Director is coupled to valid RADALT side NOTE: AT will not retard on landing if coupled to failed RADALT side *If both systems failed:* 3. AT will not retard on landing - see A/T Retard Inhibit, Page IIIA-4 NOTE: 1. Systems utilizing Radio Altimeter data are not available: Windshear Fail, Ground PROX Fail, TCAS Fail 2. The following callouts will not be available: Gear Not Down, Flaps, Glide slope, Altitude Callouts

ADVISORY MESSAGES (CYAN)

(Sheet 34 of 40)

Message	Cause(s)	Corrective Action
RAD ALT Fail	Radar altimeter failed (single installation)	Log for maintenance NOTE: 1. AT will not retard on landing - see A/T Retard Inhibit, Page IIIA-4 2. Systems utilizing Radio Altimeter data are not available: Windshear Fail, Ground PROX Fail, TCAS Fail 3. The following callouts will not be available: Gear Not Down, Flaps, Glide slope, Altitude Callouts
RIU 1 Fail RIU 2 Fail RIU 1-2 Fail	RIU failed and on-side CDU has been inhibited	See RIU (RADIO INTERFACE UNIT) FAILURES, Page IIIA-96
RIU 1A Fail RIU 2A Fail	Loss of secondary tuning of indicated radios, loss of one channel of aural alerts and lost of single data link system	See RIU (RADIO INTERFACE UNIT) FAILURES, Page IIIA-96
RIU 1B Fail RIU 2B Fail	Indicated RIU failed and on-side CDU has been inhibited	See RIU (RADIO INTERFACE UNIT) FAILURES, Page IIIA-96
RUD PDL Feedback Fail	Rudder pedal feedback actuator failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 35 of 40)

Message	Cause(s)	Corrective Action
Rudder MAINT REQD	System failure that has no Impact on flight	Log for maintenance
Rudder TCM FAIL	Rudder thrust compensation function failed	*If one engine fails:* Use rudder pedal or rudder trim for manual directional compensation
Rudder Trim SW Fail	Manual trim switch failed	Log for maintenance
SATCOM Cabin Call	Incoming satellite communications call	Answer call
SATCOM Cockpit Call	Incoming satellite communications call	Answer call
Service Door	One of the following service doors is not closed: • L/R Avionics Bay • Refuel Access/Control • Hydraulic Service • R BATT/Water Service • Lavatory Service • ATS Access • Tail Compartment • L BATT/EXT Power • APU service	*On ground:* Verify doors closed *In flight* Log for maintenance
Single Rudder	One rudder control channel unavailable	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 36 of 40)

Message	Cause(s)	Corrective Action
SMC 1 Fail SMC 2 Fail	Integrated Standby Multifunction Controller (SMC) failed	*If DCP shows a menu page:* 1. DU 2 - TURN OFF, UNTIL ISI FORMAT IS DISPLAYED ON INDICATED DCP, AND THEN TURN ON DU 2 AGAIN *If DCP blanked or displays ISI:* 2. No action available NOTE: ISI should come on the indicated DCP. No ability to change the display on DCP any more
SMC 1 Fan Fail SMC 2 Fan Fail SMC 1-2 Fan Fail	Indicated Standby Multifunction Controller (SMC) detected one or both fans failure	Log for maintenance
Speed Brake Degraded	Speed brake lever sensors have failed (only one set of speed brakes panels is available)	Log for maintenance
Speed Brake Fail	Speed brake lever sensors have failed (loss of manual speed brakes)	*In flight only:* Speed brake lever - Retract position
Spoiler MAINT REQD	Spoiler maintenance required	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 37 of 40)

Message	Cause(s)	Corrective Action
SPS Test Complete	Stick shaker relays tested successfully	No actions required
STAB Maintenance REQD	Stabilizer maintenance is required	Log for maintenance
Stick Shaker Fail, L Stick Shaker Fail, R	Control column shaker failed	NOTE: Cross side stick shaker is still operative, and stick pusher is functional
SXM GWX Fail	Post MOD G25-10074 XM graphical weather is not available	Log for maintenance
TAWS Fail	TAWS system failed	NOTE: • No Terrain Display and NO Terrain aural alerts • All radio altimeter-based alerts and callouts Not available • No Windshear Alert
TCAS STBY	Aircraft is in flight and the TCAS is in standby	1. Select the ATC/TCAS system away from STBY
TERM Charts Fail	Terminal charts are not available	Use other means of information
TERM Charts 1 Fail TERM Charts 2 Fail TERM Charts 1-2 Fail	Terminal charts are not available from indicated IFIS. (Dual installation)	1. Paperless charts dispatch is not authorized 2. Use other information

ADVISORY MESSAGES (CYAN)

(Sheet 38 of 40)

Message	Cause(s)	Corrective Action
Terrain Fail	TAWS terrain function failed	NOTE: No terrain display and no terrain aural alerts. RADALT based alerts are available (GEAR NOT DOWN, FLAPS, GS, ALT Callouts)
TFR Fail	Pre MOD G25-10074: TFR overlay is not available	Use other means of information
Thrust REV Fault, L Thrust REV Fault, R Thrust REV Fault, L-R	Thrust reverser system functional failure that may cause affected thrust reverser to fail upon landing. MMEL relief may be required for dispatch after next landing.	1. Log for maintenance 2. See MMEL for operational planning.
VHF 1 SELCAL VHF 2 SELCAL VHF 3 SELCAL	Indicated VHF radio has incoming selective call	Answer call
VHF COM 1 Fail VHF COM 2 Fail VHF COM 3 Fail	Indicated VHF communications radio failed or radio is OFF in flight	Use other VHF radio

ADVISORY MESSAGES (CYAN)

(Sheet 39 of 40)

Message	Cause(s)	Corrective Action
VHF COM 1-2 Fail VHF COM 2-3 Fail VHF COM 1-3 Fail	VHF communications radios have failed or radios are OFF in flight	Use other VHF radio
WAI Default Mode, L WAI Default Mode, R WAI Default Mode, L-R	WAI valve will open to a default position during the first 60 seconds.	Log for maintenance
WAI MAINT REQD, L WAI MAINT REQD, R WAI MAINT REQD, L-R	Wing anti-ice system requires maintenance	Log for maintenance
Windshear Fail	Windshear function failed	NOTE: No Windshear Alerts
Wing Fuel QTY DGRAD, L Wing Fuel QTY DGRAD, R	A probe in the indicated fuel tank failed and the fuel quantity data in that tank is degraded	1. Fuel synoptic - DISPLAY 2. Monitor fuel quantities and transfer
WWS Maintenance REQD	Water waste system maintenance required	1. Log for maintenance 2. Purge when required
WX Fail	Weather Radar (WX) failed	Log for maintenance

ADVISORY MESSAGES (CYAN)

(Sheet 40 of 40)

Message	Cause(s)	Corrective Action
XM GWX Fail	XM graphical weather is not available	Log for maintenance
Yaw Damper 1 Fail Yaw Damper 2 Fail	Indicated yaw damper channel of autopilot failed	Verify reversion to operating system

LEFT BLANK

EICAS STATUS MESSAGES

NOTE

1. Status CAS messages are not inhibited.
2. When any message illuminates, check appropriate switches and circuit breakers.
3. Status (white) messages do not cause the MASTER CAUTION light to illuminate.
4. White messages are status in nature and normally will not require corrective action.

STATUS MESSAGES (WHITE)

(Sheet 1 of 9)

Message	Cause(s)	Corrective Action
Advisory CAS Inhibit	New advisory CAS messages Inhibited	CAUTION: DO NOT SELECT ADVISORY CAS INHIBIT BELOW 10,000FT. 1. SMC - TEST
Alternate Flaps On	Alternate flaps channel active	
APU Door Open	Post MOD G25-10074: APU Door indicates it is open while aircraft on ground and APU Master not selected on.	This message should clear within 50 seconds of APU Master selection to Off.
APU GEN Switch Off	APU GEN off	
Auto APR Inhibit	Auto APR disarmed and acknowledged	
Autobrake High	Auto brakes in high position	
Autobrake Low	Auto brakes in low position	
Autobrake MED	Auto brakes in MED position	
Autobrake RTO	Auto brakes in RTO position	

STATUS MESSAGES (WHITE)

(Sheet 2 of 9)

Message	Cause(s)	Corrective Action
BATT Switch Off, L BATT Switch Off, R BATT Switch Off, L-R	Indicated BATT switch is off	
CAS Aurals Inhibit	Inhibits the aural alerts associated with all CAS messages	See CONTINUOUS NUISANCE AURAL WARNING, page IIIA-193 NOTE: CAS aural inhibit will be cancelled as aircraft descends through 18,000 ft and every 60 minutes of selection. CAS aural inhibit function can be reselected after auto inhibit cancellation.

STATUS MESSAGES (WHITE)

(Sheet 3 of 9)

Message	Cause(s)	Corrective Action
CDU Tune Inhib, L-C-R CDU Tune Inhib, L-R CDU Tune Inhib, C-R CDU Tune Inhib, L-C CDU Tune Inhib, L CDU Tune Inhib, C CDU Tune Inhib, R	Control Display Unit (CDU) tune is inhibited	
CONT Ignition On, L CONT Ignition On, R CONT Ignition On, L-R	Continuous ignition is selected on	
CPCS LFE Manual	CPCS Landing Field Elevation (LFE) is selected manually	Verify correct landing field elevation entered or, select FMS
Dataload Switch On	Pre MOD G25-10074: Data load switch is on	NOTE 1. Switch should be in Off position unless for required maintenance. 2. RSE cannot align while switch in on position.

STATUS MESSAGES (WHITE)

(Sheet 4 of 9)

Message	Cause(s)	Corrective Action
DU Tune Inhibited	All display units tune is inhibited	*To cancel selection:* SMC - TEST - Tune REV
EMP HYD Pump On, L EMP HYD Pump On, R EMP HYD Pump On, L-R	The message indicates the EMP HYD pump is ON and pressure above 900 psi.	HYD EMP – AS REQUIRED
ENG A/I Test OK, L-R	engine anti-ice aircraft wiring and electrical components were tested for operation/ continuous and operate properly	
ENG Anti-Ice On, L ENG Anti-Ice On, R ENG Anti-Ice On, L-R	Engine anti ice is selected to auto and activated, or, on and is operating normally	
Event Record	Engine EVENT pushbutton pressed	
External Baggage Door	On ground - external baggage door unlocked, and either engine is running and ACK DOOR switch is pressed	

STATUS MESSAGES (WHITE)

(Sheet 5 of 9)

Message	Cause(s)	Corrective Action
FADEC MAINT Switch On	FADEC maintenance switch is on. Switch is located in the radio rack behind the pilot	
Fire/Bleed In Test	Fire and bleed system test in progress	
Fire/Bleed Test OK	Fire and bleed system test passed ok	
Fuel INTER Valve Open	Fuel interconnect valve open	
Fuel Pump Not Arm, L Fuel Pump Not Arm, R Fuel Pump Not Arm, L-R	Post MOD G25-10074 Indicated fuel standby pump(s) not in ON or ARM position	1. Fuel STBY pump(s) OFF/ARM – ARM AS REQUIRED ***In air:*** If PUMP PWR or PUMP CTRL CB (H1, H11, I7, I17) has popped: 1. Reset CB only if required for safety of flight. 2. Select FUEL STBY PUMP to ON whenever required. 3. Continue flight. **NOTE**: If PUMP CTRL has popped - no Fuel STBY operation is possible. If PUMP PWR has popped - manual override and jettison will activate the STBY fuel pump.

STATUS MESSAGES (WHITE)

(Sheet 6 of 9)

Message	Cause(s)	Corrective Action
Fuel XFLOW Valve Open	Fuel X flow (cross flow) valve open less than 5 minutes	
GEN Switch OFF, L GEN Switch OFF, R GEN Switch OFF, L-R	Indicated generator switch is off	
Ground Spoiler INHIB	In flight only. ground spoilers inhibit selected or switch failed	1. Use manual speed brakes for landing 2. Anticipate increase of 25% in actual landing distance
GND Spoilers Deployed	Ground spoilers deployed as required upon landing. The Ground spoilers self retract below 50 kts GS.	
Ice Detector Test OK	Ice detector test passed ok	
Isolation Valve Open	Isolation valve is open	

STATUS MESSAGES (WHITE)

(Sheet 7 of 9)

Message	Cause(s)	Corrective Action
Main Entry Door	On ground: main entry door not closed or locked, and, either engine running, and, PARK BRAKE off, and, airspeed below 80 kt, and, ACK DOOR switch pressed	
Maintenance Intercom	Maintenance intercom jack is in use. (nose or baggage)	
Master Crank On	Engine master crank is on	
Parking Brake	On ground: PARK BRAKE lever not in off or full travel position, or, above 200 psi in emergency lines	Verify parking brake lever position
Parking Brake On	On ground: PARK BRAKE lever at full travel and above 700 psi in emergency lines	
Rudder TCM OVRD	Rudder thrust compensation function deselected	TCM pushbutton - AS REQUIRED

STATUS MESSAGES (WHITE)

(Sheet 8 of 9)

Message	Cause(s)	Corrective Action
Speed Brakes Extended	Speed brakes are extended	
Speed Brakes Retracted	Speed brakes handle is in extend position and speed brakes have retracted (TOGA press or Thrust lever above MAX CLB position).	Speed brakes Handle – AS REQUIRED
STBY Pump On, L STBY Pump On, R STBY Pump On, L-R	The message indicates the Fuel STBY pump is ON and pressure above 900 psi.	FUEL STBY – AS REQUIRED
TAWS Flap Override	TAWS flap override is selected	NOTE: No flap aural alerts.
TAWS GS Cancel	Terrain Awareness Warning System (TAWS) glideslope cancel is selected	NOTE: No glideslope aural alerts
TAWS RAD ALT Override	Terrain Awareness Warning System (TAWS) radar altimeter override is selected	NOTE: No radar altitude callouts
TAWS Voice Override	Terrain Awareness Warning System (TAWS) voice override is selected	NOTE: No TAWS aural alerts

STATUS MESSAGES (WHITE)

(Sheet 9 of 9)

Message	Cause(s)	Corrective Action
Terrain Inhibit	Terrain Awareness Warning System (TAWS) terrain inhibit (data overlay on MAP) is selected	NOTE: No terrain data overlay on MAP display
Thrust REV DEACT, L Thrust REV DEACT, R Thrust REV DEACT, L-R	Indicated reverser(s) manually pinned/locked	NOTE: Thrust reverser(s) are not operational
Wing Anti Ice On, L Wing Anti Ice On, R Wing Anti Ice On, L-R	Associated wing anti-ice is on	*If out of icing conditions:* Both WAI selectors - OFF

PRE-FLIGHT

FIRST FLIGHT OF THE DAY

Whenever a thruflight item box appears within a procedure step (a framed procedure step number such as [24]), this step must be performed on the second flight of the day.
The following criteria defines events of first flight of the day when the full procedure must be performed:

1. Change in flight crew personnel
2. New date entered into the flight log
3. Maintenance action other than routine line servicing
4. More than five (5) hours elapsed between engine shut-down and engine start
5. Extreme weather conditions such as: heavy rain, snow, ground icing and extremely cold temperature

FUEL DRAIN VALVE AND DUMP VALVE DRAINING

The seven (7) fuel drain valves should be drained until all traces of water or other contaminants are no longer evident in the sampled fuel. Procedures for draining these valves is found in the G280 Airplane Maintenance Manual and may be performed by maintenance personnel or appropriately trained flight crew. Draining procedures are to be accomplished prior to the first flight of the day when departing a maintenance base or at intervals not to exceed 10 days, whichever occurs first.

COCKPIT PRE-FLIGHT INSPECTION

Preflight inspection to be accomplished before each flight.
Insure that fuel type in the aircraft matches that selected in the avionics system (refuel/defuel panel or SMC-FUEL or summary page).

1. Certificates ..... CHECK (AVAILABILITY AND VALIDITY)
2. Flight log, flight manual, trip books and charts ..... CHECK
3. Weight and Balance ..... CALCULATE
4. Safety equipment check:
   a. Cockpit and cabin portable fire extinguisher ..... CHARGED & SECURED
   b. First aid kit ..... SECURED
   c. Crash axe (if installed) ..... SECURED

Cockpit

[5]. Circuit breakers ..... CHECKED; ALL IN
[6]. LANDING GEAR lever ..... DOWN
[7]. STBY BATT ..... ON;

NOTE

Pushbutton is not lit. Both DCP and DSP come on. If the DCP and DSP do not come on, check CB-1 is pushed in on the front of the emergency battery located in the left hand forward avionics rack behind the waste and water control panel.

8. EMER BUS ..... BATT ON
   ..... (wait 10 seconds until Left DU is fully powered up)
9. EMER BUS ..... OFF
[10]. Both BATT ..... ON

(Continued)

[11]. Overhead panel and pedestal pushbuttons .....ALL OFF (OUT) except:
- a. Both BATT, STBY BATT, both ENG GEN and APU GEN
- b. UTILITY..... ALL ON
- c. PACK .....ON
- d. TEMP CONTROL - COCKPIT and CABIN. ..... AUTO
- e. CPCS MODE ..... MAN
- f. COCKPIT LTS MASTER.....ON

[12]. Fuel..... CHECK QTY, DISTRIBUTION AND TYPE

NOTE

Extended running of the APU on the ground without engines running, may reduce right feed tank to below maximum level.

[13]. PARK BRAKE ..... SET
OPERATE LEFT EMP IF BOTH BRAKE ACCUMULATOR PRESSURES ARE BELOW 1300 PSI

NOTE

Parking Brake On status message comes on when lever is latched.

[14]. GUST LOCK ..... UNLOCKED

[15]. APU..... AS REQUIRED
(SEE APU START (ON GROUND), page IV-10)

<<END>>

EXTERIOR INSPECTION

NOTE

1. If any items are missing on preflight inspection, refer to Configuration Deviation List (CDL).
2. Prior to flight in RVSM airspace, the flight crew shall review the maintenance log for any repairs on and around the static port area since the last flight in RVSM airspace.
3. Inspect Pitot Static drains in the nose compartments if the airplane has been exposed to heavy rain

1. Ensure ground area is free of foreign objects
2. Check condition of fuselage, all surfaces, lights and antennas during walk-around
3. Inspect for evidence of leaks: fuel, oil and hydraulic

Left Forward Fuselage:

4. Door entrance light ..... CHECK
5. Main entry door view port..... CHECK
6. Main entry door / seal ..... CHECK CONDITION
7. L angle of attack (AOA) vane ..... COVER REMOVED / CHECK
8. L pitot, L ice detector and TAT probes..... COVER REMOVED/ CHECK

NOTE

Examine for evidence of FOD and/or physical blockage of the probe by foreign material.

9. Side window / windshield ..... CHECK
10. L nose avionics door ..... CLOSED
11. Radome / EVS window ..... CHECK

(Continued)

12. Nose landing gear doors ..... CHECK CONDITION AND ACTUATING RODS
13. Nose landing gear .....CHECK (HARNESSES, HOSES, STRUCTURE, TAXI LTS)
14. Nose wheels and tires..... CHECK CONDITION
15. Nose landing gear safety pin .....REMOVED
16. Nose landing gear strut extension ..... AS REQUIRED
17. Tow bar adapter .....SECURED

NOTE

Verify that the shear pin and cotter pin are properly installed, undamaged and in place.

18. Oxygen discharge indicator .....CHECK
19. Nose compartment ventilation inlets & outlets .....CHECK CLEAR

Right Forward Fuselage:

20. R angle of attack (AOA) vane .....COVER REMOVED / CHECK
21. R pitot, R ice detector probes .....COVER REMOVED / CHECK
22. STBY pitot cover .....COVER REMOVED / CHECK
23. Side window / windshield .....CHECK
24. R nose avionics door ..... CLOSED
25. Outflow valve .....CHECK OPEN / CLEAR OF OBSTRUCTIONS
26. R static ports and rvsm region .....COVER REMOVED / CHECK
27. Window emergency releases / windows .....SECURE / CHECK
28. R ice inspection light ..... CHECK CONDITION
29. Antennas.....CHECK
30. Refuel defuel panels (RDP) .....CHECK / CLOSED
31. Forward emergency lights (above and below wing).....CHECK

(Continued)

Right Wing Area

32. R landing light ..... CHECK
33. Wing leading edge ..... CHECK
34. Wing fuel vent ..... CLEAR
35. Gravity fueling filler cap access panel ..... SECURED
36. NAV / Strobe Lights ..... CHECK
37. Winglet and aileron static wicks ..... CHECK
38. Aileron surface and tab ..... CHECK ALIGNMENT
39. Fuel jettison port ..... CLEAR
40. Aileron / aileron gear tab / flaps / spoilers ..... CHECK
    Check surfaces for damage, security of attach points, condition of all actuators, aileron tab gear free play, plumbing and cables forward of the flaps. Check condition of flap rollers.
41. Main landing gear (MLG) fairing door / strut ..... CHECK
    Check Alignment within red band, and actuating rods
42. MLG brake wear indicator (inboard / outboard) ..... CHECK
43. MLG WOW ..... CHECK
44. MLG strut extension ..... 1 INCH MINIMUM
45. MLG tires / brakes / plugs ..... CHECK
46. MLG uplock ..... CHECK

CAUTION

IF ANY LANDING GEAR UPLOCK IS NOT OPEN, THAT LANDING GEAR WILL NOT LOCK UP AFTER RETRACTION.

47. MLG wheel well area ..... CHECK
48. MLG safety pin ..... REMOVE

(Continued)

Right Aft Fuselage:

49. Emergency exit .....SECURED
50. Dorsal fin air scoop ..... CLEAR
51. Hydraulic accumulators / pneumatic bottle pre charge .....CHECK
52. HYD MAINT / R BATT / WATER and WASTE service doors..... CLOSED
53. Engine:
    a. Intake ground cover .....REMOVED
    b. Nacelle intake + probes ..... CLEAR
    c. Fan blades ..... CHECK CONDITION
    d. Cowling & latches .....SECURED
    e. Exhaust ground cover .....REMOVED
    f. Exhaust..... CLEAR
    g. Rear turbine blades ..... CHECK CONDITION
54. Heat exchanger outlet..... CLEAR
55. AIR conditioning unit outlet ..... CLEAR
56. Pre-cooler exhaust..... CLEAR
57. APU inlet door..... CHECK CONDITION

Tail Area:

58. Empennage ..... CHECK CONDITION
59. Battery vents ..... CLEAR
60. Tail Compartment Door ..... CLOSED
61. Horizontal stabilizer..... CHECK CONDITION
62. Static wicks .....CHECK
63. Rudder .....CHECK
64. Tail position + logo lights ..... CHECK CONDITION
65. APU tailpipe .....CHECK
66. APU service door ..... CLOSED
67. APU generator inlet..... CLEAR

(Continued)

Left Aft Fuselage:

68. Engine:
    a. Intake ground cover ..... REMOVED
    b. Nacelle intake + probes ..... CLEAR
    c. Fan blades ..... CHECK CONDITION
    d. Cowling & latches ..... SECURED
    e. Exhaust ground cover ..... REMOVED
    f. Exhaust ..... CLEAR
    g. Rear turbine blades ..... CHECK CONDITION
69. Air turbine starter door ..... AS REQUIRED
70. Baggage door ..... SECURE

NOTE

Recommend door not be locked prior to flight. If locked, the baggage door cannot be opened from inside the aircraft in an emergency.

71. L BATT / EXT PWR doors ..... CLOSED / AS REQUIRED

Left Wing Area:

72. Main landing gear (MLG) fairing door / strut ..... CHECK
    Check Alignment within red band, and actuating rods
73. MLG brake wear indicator (inboard / outboard) ..... CHECK
74. MLG WOW ..... CHECK
75. MLG strut extension ..... 1 INCH MINIMUM
76. MLG tires / brakes / plugs ..... CHECK
77. MLG Up-lock ..... CHECK

CAUTION

IF ANY LANDING GEAR UPLOCK IS NOT OPEN, THAT LANDING GEAR WILL NOT LOCK UP AFTER RETRACTION.

(Continued)

78. MLG wheel well area .....CHECK
79. MLG safety pin.....REMOVE
80. Fuel jettison port ..... CLEAR

81. Aileron / aileron gear tab / flaps / spoilers.....CHECK
    Check surfaces for damage, security of attach points, condition of all actuators, aileron gear tab free play, plumbing and cables forward of the flaps. Check condition of flap rollers.

NOTE

To determine if the gear tab is normal, move the aileron manually with one hand and, while holding the gear tab with other hand, observe if there is any free play. A normally-operating gear tab will not exhibit any free play when the aileron is moved.

82. Aileron surface and tab .....CHECK ALIGNMENT
83. Winglet and aileron static wicks .....CHECK
84. NAV / strobe lights .....CHECK
85. Gravity fueling filler cap access panel.....SECURED
86. Wing fuel vent ..... CLEAR
87. Wing leading edge .....CHECK
88. L landing light.....CHECK

Left Forward Fuselage:

89. Windows ..... CHECK (INTACT AND CLEAN)
90. L ice inspection light..... CHECK CONDITION
91. L Static ports and RVSM region..... CLEAR
92. Emergency lights .....CHECK
93. Landing gear safety pins / pitot probe covers ..... STOWED

<<END>>

APU OPERATIONS

APU START (ON GROUND)

1. Both BATT.....ON (22-27 V);
2. NAV light .....ON
3. FIRE SYS TEST.....PRESS

NOTE

Verify red light in fire handles, fuel control switches, and APU FIRE pushbutton and illumination of APU ARM / EMPTY pushbutton.
Verify that Fire/Bleed Test OK status message is displayed within 11 seconds.

4. R STBY pump (If right engine is off).....ON
5. APU MASTER.....ON

NOTE

1. The APU START switch may be pressed to START immediately after pressing MASTER switch to ON without waiting for the READY annunciation.
2. Verify that READY annunciation on APU synoptic (or SMC) comes on after 25 seconds.

6. APU START .....PRESS
7. APU GEN..... VERIFY ON WHEN 28V; CHECK LOAD

(Continued)

8. APU BLEED AIR ..... AS REQUIRED

NOTE

The APU GEN and bleed air are deactivated during the APU start even if left in the ON position. The GEN will come on line 4 seconds after the start sequence is completed (95% RPM) and bleed air after 90 seconds if left on.

<<END>>

APU START (IN FLIGHT)

1. R STBY pump (If right engine is off).....ON
2. APU MASTER.....ON

NOTE

1. The APU START switch may be pressed to START immediately after pressing MASTER switch to ON without waiting for the READY annunciation.
2. Verify that READY annunciation on APU synoptic (or SMC) comes on after 25 seconds.

3. APU START .....PRESS
4. APU GEN.....VERIFY ON WHEN 28V; CHECK LOAD
5. APU BLEED AIR .....AS REQUIRED, BELOW 20,000 FT

NOTE

If APU BLEED AIR is required in flight, it will be available immediately on single engine, and after 90 seconds after start sequence is completed if both engine operating.

<<END>>

APU SHUTDOWN (GROUND OR FLIGHT)

1. APU STOP ..... PRESS
2. APU RPM and EGT ..... MONITOR

When APU RPM less than 5%:

3. APU MASTER ..... OFF

NOTE

1. APU RPM and EGT indications are displayed for 5 minutes after the APU RPM drops to less than 5% and the APU MASTER pushbutton is off, provided that the APU ECU is powered.
2. At any time, if the APU MASTER pushbutton is pressed OFF, the APU immediately shuts down.

4. R STBY PUMP ..... AS REQUIRED
5. APU BLEED AIR ..... OFF

<<END>>

ENGINE STARTING

BEFORE STARTING ENGINES

[1]. Circuit breakers ..... CHECKED ALL IN
[2]. Preflight checks ..... COMPLETE
[3]. Electrical power ..... AS REQUIRED
APU GEN / EXT PWR / BATT
4. Hydraulic accumulators ..... CHECK

NOTE

If hydraulic accumulators pressure is less than 1300 psi, operate associated EMPs until pressure is 2900 psi

[5]. PARK BRAKE lever ..... SET

NOTE

Parking Brake On status message comes on when lever is latched.

Overhead Panel Checks and Setting

6. ANN LTS ..... PRESS / CHECK LTS
7. Both ENG ANTI-ICE ..... AUTO

(Continued)

[8]. ICE DETECT TEST.....PRESS

NOTE

1. Ice Detector Test OK and ENG A/I Test OK, L-R status messages come on when test is completed successfully.
2. If ENG A/I Test OK, L-R status message does not appear, automatic engine anti-ice should be treated as failed. Dispatch into known icing conditions is still allowed if engine anti-ice is verified operational with the selector in the ON position after engine start. To verify manual engine anti-ice operation - after engine start, rotate both ENG ANTI-ICE selectors to ON position, confirm green A/I symbol in N_1 dials, ITT increase on both engines and the ENG Anti-Ice On, L-R status message appears.

[9]. FIRE SYS TEST (If not performed before APU start) .....PRESS

NOTE

Verify red light in fire handles, fuel control switches, and APU FIRE pushbutton and illumination of APU ARM / EMPTY pushbutton.
Verify that Fire/Bleed Test OK status message is displayed within 11 seconds.

10. FUEL INTERCONNECT .....CYCLE AND CLOSE

NOTE

Fuel INTER Valve Open status message is displayed.

(Continued)

11. FUEL XFLOW ..... CYCLE AND CLOSE

NOTE

Fuel XFLOW Valve Open status message is displayed.

12. Both STBY PUMPS.....OFF

NOTE

Leave R STBY PUMP on if APU is running.

[13]. CPCS MODE .....AUTO
14. WING and ENG ANTI-ICE .....AUTO
[15]. PROBE HEAT .....OVRD (15 seconds max.); then - AUTO

NOTE

Verify no CAS messages come on.

16. EMER LTS ON .....ON / CHECK / OFF
[17]. EMER LTS OFF/ARM .....ARM
[18]. SEAT BELT and NO SMOKE .....ON

Panels and Pedestal Checks and Setting

19. Autopilot ..... CHECK

NOTE

Engage Autopilot. Check the disconnect switches on both yokes and check FMA annunciations.

[20]. PASSENGER OXYGEN.....AUTO
21. THERAPEUTIC OXYGEN .....OFF
[22]. OXYGEN SHUTOFF.....ON
23. OXYGEN PRESSURE ....CHECK
24. Crew oxygen masks.....CHECK Condition, Operation and Boom
25. Emergency landing gear handle ..... STOWED
26. FIRE handles ..... IN
27. LANDING GEAR lever .....DOWN / 3 GREEN

(Continued)

[28]. Thrust levers ..... .IDLE
[29]. GUST LOCK ..... AS REQUIRED

NOTE

Thrust levers must be in idle prior to engaging the gust lock.

30. ALTN FLAPS.....CHECK

NOTE

Select ALTN FLAPS pushbutton. Alternate Flaps On status CAS will come on and pushbutton illuminated. Deselect pushbutton and CAS will clear.

31. Engine FUEL CONTROL ..... OFF
32. SPEED BRAKES ..... RETRACT
33. NWS..... DISCONNECT
34. AILERON DISCONNECT handle..... STOWED
[35]. STAB TRIM (ALTN, PRIM).....CHECK

(Continued)

[36]. AILERON TRIM..... CHECK / SET 0°
37. RUDDER TRIM. ..... CHECK / SET 0°
38. SMC:
[a].STALL TEST .....TEST
b. TCAS TEST .....TEST
c. TAWS TEST.....TEST
39. SENSR page..... AS REQUIRED

Avionics and Instruments:

[40]. Altimeters .....SET
[41]. FMS..... INITIALIZED and PROGRAMMED
[42]. Landing field elevation ..... SET (SMC-UTIL-CPCS)
[43]. Performance.....CALCULATE
[44]. Vspeeds ..... CHECKED / SET

NOTE

If Vspeeds are displayed, any change of flaps setting causes the Vspeeds to be deselected from display.

45. Crew briefing ..... ACCOMPLISH

The takeoff briefing should include the normal callouts during the acceleration phase to V1 and VR, runway and departure SID (if Know), ATC clearance (if know), takeoff configuration, climb performance and Go/No-Go criteria should be addressed, including specific duties during and aborted takeoff.

<<END>>

ENGINE START

NOTE

If engine restarts are required between 15 and 180 minutes following an engine shutdown, dry motoring is required prior to initiating a normal start sequence in order to reduce thermal binding of the LP rotor. See ENGINE DRY CRANKING, page IV-63. Wait a minimum of 3 minutes before engine start. If the engine is not started within 40 minutes of Dry Cranking, and it has been less than 180 minutes since engine shutdown, Engine Dry Cranking must be repeated prior to engine start.

1. Cockpit displays ..... SET FOR ENGINE START
2. Start clearance ..... REQUEST
3. BCN LTS ..... ON
4. PARK BRAKE ..... SET
5. APU BLEED ..... ON

CAUTION

Recommended indicated Bleed Air pressure to initiate engine start is approximately 32 PSI below 10,000' MSL and approximately 26 PSI above 10,000' MSL. The engine can be started with pressures lower than these but the possibility of a hot start increases. Monitor ITT closely during the engine start.

(Continued)

First engine start:

6. Thrust levers ..... IDLE
7. Engine FUEL CONTROL ..... RUN
8. FUEL STBY PUMP ..... ON

NOTE

STBY Pump On, L or STBY Pump On, R status message comes on.

9. HYDRAULIC EMP..... ON

NOTE

EMP HYD Pump On, L or EMP HYD Pump On, R status message comes on.

10. Danger areas ..... CLEAR

(Continued)

CAUTION

ABORT THE START BY TOGGLING THE FUEL CONTROL SWITCH TO OFF POSITION IF:

1. NO N_2 ROTATION.
2. N_2 FAILS TO REACH IDLE SPEED WITHIN ENGINE START TIME LIMITATIONS.
3. NO N_1 ROTATION BY 25 PERCENT N_2.
4. LIGHT-OFF DOES NOT OCCUR WITHIN 30 SECONDS OF START INITIATION.
5. N_1 OR N_2 STOPS ACCELERATING TO IDLE (HUNG START).
6. NO POSITIVE INDICATION OF OIL PRESSURE BY 30 PERCENT N_2.
7. ITT rises rapidly through maximum start limit of 650°C up to 40% N_2.
8. ANY UNUSUAL NOISE OR VIBRATION.
9. ATS VALVE FAILS TO CLOSE (SVO) SYMBOL IS ON AFTER ENGINE REACHED IDLE AND/OR Starter Fail On, L or Starter Fail On, R CAUTION MESSAGE DISPLAYED).
10. IF ANOTHER START IS ATTEMPTED –
    A. CLEAR ENGINE OF FUEL AND VAPOR BY ENGINE DRY CRANKING, page IV-63 PRIOR TO ATTEMPTING ANOTHER START.

(Continued)

B. DO NOT EXCEED STARTER DUTY CYCLE OF:

- THREE CONSECUTIVE START CYCLES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS AND MOTORING.
- A MAXIMUM OF 5 MINUTES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR MOTORING.

NOTE

The engine start cycle incorporates an overtemperature start protection function that terminates a ground start if ITT limit is exceeded for 5 seconds.

(Continued)

11. START/CRANK ..... PRESS ONE SECOND
12. Engine indications ..... MONITOR

NOTE

Observe proper engine start sequence on the primary EICAS display, as follows:

- SVO (Starter Valve Open) symbol is on.
- N_2 rotation.
- IGN green symbol is on.
- Fuel flow increase.
- N_1 rotation.
- IGN symbol is off.
- Make sure N_1 rotation is indicated before N_2 reaches 25%
- Make sure the oil pressure indication is provided before N_2 reaches 30%.
- N_1, N_2, FF and ITT indications are rising and stabilized at ground idle (N_1 is stabilized between 20% and 25%).
- Verify the hydraulic pressure in corresponding system is rising (expected at 12%-15% N_2).
- IGN symbol is cleared before N_2 reaches 50%
- SVO symbol is cleared before engine stabilized at ground idle.

When engine at idle:

13. FUEL STBY PUMP ..... OFF then ARM

NOTE

STBY Pump On, L or STBY Pump On, R status message clears.

(Continued)

14. HYDRAULIC EMP..... OFF then ARM

NOTE

EMP HYD Pump On, L / EMP HYD Pump On, R status message clears.

15. ENG ANTI-ICE ..... AS REQUIRED

NOTE

If OAT is less than 10°C and visible moisture select ENG ANTI-ICE to ON.

Second engine start:

16. Repeat steps 6 through 15 for second engine

When both engines at idle:

17. Hydraulic pressures ..... CHECK (3000 PSI)
18. Both generators..... VERIFY ON (LOAD, VOLTS)

NOTE

A/C S/N 2001 - 2011: if second generator does not come on-line after engine start and GEN FAIL caution message comes on, deselect APU GEN, and then press RESET

(Continued)

19. Both ENG BLEED AIR .....ON

NOTE

ENG BLEED pushbutton illuminates OFF if APU bleed is selected to ON - on ground.

20. APU / APU BLEED ..... AS REQUIRED
21. WING ANTI-ICE ..... AS REQUIRED
22. EXT PWR (If used) ..... DISCONNECT

NOTE

When connected - AVAIL light is on.

<<END>>

AFTER START

1. Cockpit displays ..... SET FOR TAXI
2. Flaps ..... SET FOR TAKEOFF (10° or 20°)
3. Flight controls / speed brakes ..... CHECK / RETRACT
4. Trims ..... SET

NOTE

The STAB trim should be set according to the tables in Figure 5-45 for flaps – 20, Figure 5-46 for flaps – 10, and Figure 10-5-2 for flaps – 0. When programmed with the correct ZFWCG and fuel load, the FMS Takeoff Performance page will provide the correct STAB trim setting from the AFM. If the resulting STAB trim setting is slightly outside the green band, move the setting just inside the green band.

5. NWS ..... CONNECT
6. Taxi clearance ..... RECEIVED
7. Chocks ..... REMOVED
8. PARK BRAKE ..... OFF
9. TAXI LTS ..... ON
10. Doors ..... ALL CLOSED

<<END>>

TAXI/BEFORE TAKEOFF

1. Transponder ..... AS REQUIRED
2. Brakes and steering ..... CHECK
3. Thrust reversers ..... CHECK

NOTE

T/R green symbol display in N_1 dial when thrust reverser is open.

4. Flight Instruments / NAV sensors ..... CHECK / SET
5. ENG and WING ANTI-ICE ..... CHECK / AS REQUIRED
6. If wing anti-ice is required - Using synoptic, verify wing anti-ice temperatures are 130°F ± 10° and both wings green prior to takeoff

WARNING

MINUTE AMOUNTS OF ICE OR OTHER CONTAMINATION ON THE LEADING EDGES OR WING UPPER SURFACES CAN RESULT IN A STALL WITHOUT WARNING, LEADING TO LOSS OF CONTROL ON TAKEOFF.

7. Thrust mode ..... VERIFY T/O, CHECK POINTERS, CONFIRM RATING
8. Flaps ..... SET / (10° or 20°) / VERIFY; both pilots verify that the flaps set for takeoff is the setting for which the takeoff performance has been calculated.

WARNING

THE TAKEOFF WARNING SYSTEM (TOWS) DOES NOT CROSS-REFERENCE TAKEOFF REFERENCE SPEEDS. THE TOWS WILL NOT ALERT THE CREW FOR FLAP SETTINGS LESS THAN 22°. CONFIRM THAT THE ACTUAL FLAPS POSITION THAT IS REQUIRED FOR TAKEOFF IS APPROPRIATE FOR THE CALCULATED REFERENCE TAKEOFF SPEEDS.

(Continued)

9. Vspeeds ..... CONFIRM
10. FCP and flight directors..... SET / CONFIRM
11. Autobrakes ..... AS REQUIRED

NOTE

Autobrake RTO, status message comes on when RTO mode selected.

12. Crew briefing .....COMPLETED

NOTE

Accomplish takeoff briefing if not previously accomplished. Brief changes to runway, departure SID, ATC clearance, etc as required.

13. Battery charge current..... CHECK

NOTE

If charge current is above limitation, monitor amps and verify decreasing. If amps do not decrease, dispatch not authorized.

14. Cockpit displays ..... SET FOR TAKEOFF

NOTE

EICAS should be displayed on both DU 1 and DU 3 for takeoff/landing phase of flight – Stacked EICAS or 1/4 window EICAS per pilot's discretion.

<<END>>

LINE UP

1. GUST LOCK ..... VERIFY UNLOCKED
2. Controls..... VERIFY FREE MOVEMENT
3. T/O box ..... CONFIRM
4. WX radar..... AS REQUIRED
5. ENG and WING ANTI-ICE ..... AS REQUIRED
6. WINDSHIELD HEAT ..... AS REQUIRED
7. LDG and STROBE LTS ..... ON
8. Transponder..... AS REQUIRED
9. EICAS ..... CHECKED

When Cleared for takeoff:

10. Runway heading ..... CONFIRM
11. PROBE HEAT ..... OVRD IF ICING CONDITIONS EXIST

WARNING

Failure to select PROBES HEAT to OVRD when icing conditions exist can result in loss of any or all airspeed indications at any time during the takeoff roll. If airspeed indication is lost due to ice contamination with the PROBES HEAT in AUTO, normal indications should return shortly after becoming airborne.

(Continued)

NOTE

Limit the use of OVRD to thirty (30) seconds on the ground.

Icing conditions on the ground and for takeoff exist when the Static Air Temperature (SAT) is 10°C (50°F) or below, and visible moisture in any form is present (such as clouds, fog with visibility of one mile or less, rain, snow, sleet and ice crystals). Icing conditions also exist when the SAT is 10°C (50°F) or below when operating on ramps, taxiways or runways where surface snow, ice, standing water, or slush are present.

Probe Heat operation in OVRD mode onground for more than 30 seconds may result in the following:

– ISA/SAT/TAT will quickly rise to out of range indications and following messages will occur
– TCAS Fail CAS message
– TCAS FAIL appears on HSI and MAP
– ACS Default Mode CAS message
– Windshear Fail CAS message
– TURB FAIL appears on HSI and MAP
– L-R ENG Minor Fault CAS message

<<END>>

IN FLIGHT

CLIMB

1. Landing gear lever ..... UP

NOTE

If landing gear is intentionally left extended, smoothly pull the parking brake handle up momentarily when safely airborne to manually command wheel despin. Failure to stop the wheels after lift off may result in a Thrust REV Fail caution message.

At V_{SE} – 10 minimum and accelerating:

2. Flaps ..... UP
3. Climb thrust ..... SET (green CLB symbol)
4. Autopilot ..... AS REQUIRED
5. EXT LTS ..... AS REQUIRED
6. WING and ENG ANTI-ICE ..... AS REQUIRED

NOTE

Moving the ENG A/I switches from AUTO to ON or ON to AUTO when the Ice Detected message is displayed may cause the ENG Anti-Ice Fail Caution message to display.

7. PROBE HEAT ..... AUTO
8. CPCS ..... MONITOR

NOTE

Post MOD G25-10074: The Rate indication on the display units is filtered to avoid showing small, rapid changes. Therefore, it may lag the actual rate change. The Rate display on the SMC - UTILTIES - Cabin Pressure page is not filtered and shows the actual, instantaneous value.

(Continued)

At transition altitude:

9. Altimeters ..... STD
10. Windshield Heat ..... ON
11. LDG LTS ..... AS REQUIRED
12. APU ..... AS REQUIRED

<<END>>

CRUISE

1. Autopilot ..... AS DESIRED
2. Baggage interior door ..... CLOSED ABOVE 40,000 FT
3. Panel sweep ..... COMPLETE

<<END>>

CABIN ALTITUDE / PRESSURE SCHEDULE

The following charts present the automatic cabin altitude schedule for climb and cruise. It does not represent the descent schedule which is based on the Landing Field Elevation (LFE):

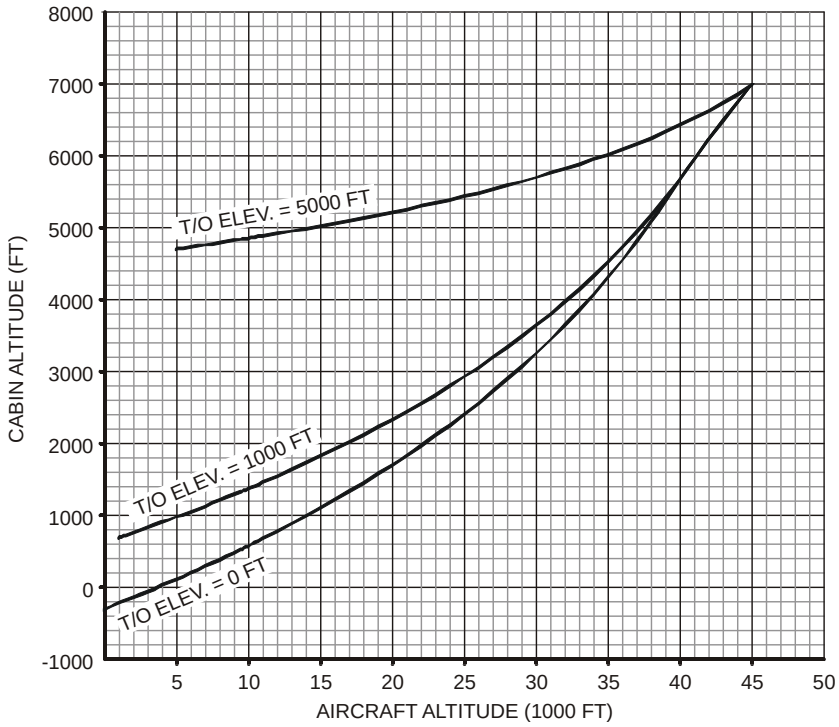

Figure 4-1. Cabin Altitude Schedule

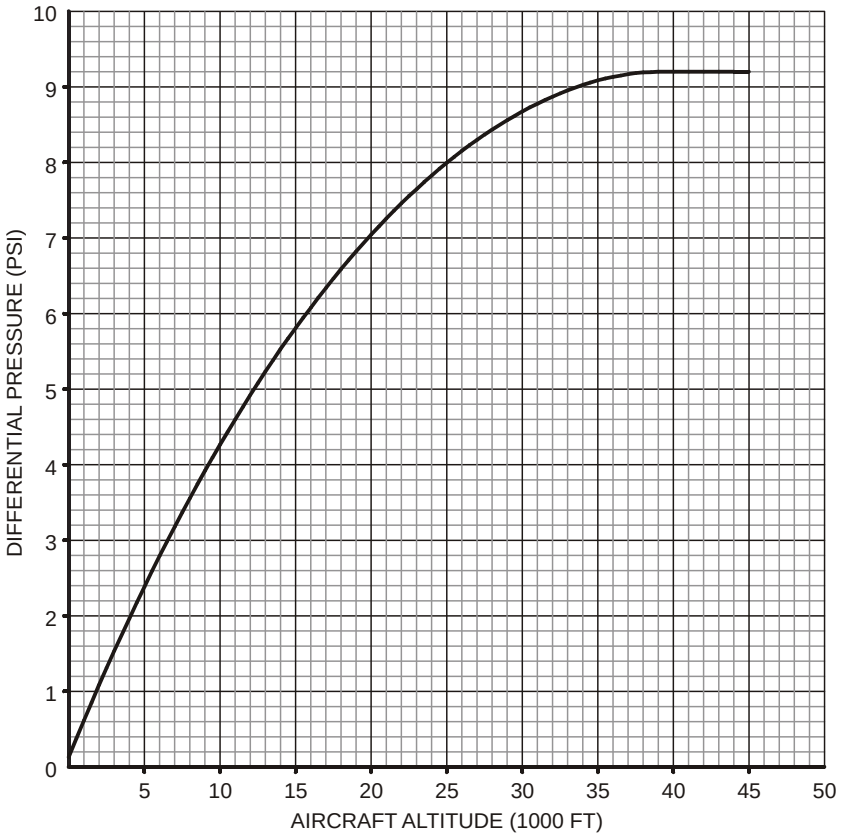

Figure 4-2. Cabin Differential Pressure Schedule

BEFORE DESCENT

1. Fuel quantity & balance .....CHECK
2. WING and ENG ANTI-ICE ..... AS REQUIRED

NOTE

Moving the ENG A/I switches from AUTO to ON or ON to AUTO when the Ice Detected message is displayed may cause the ENG Anti-Ice Fail Caution message to display.

3. Landing field elevation .....CHECK
4. ATIS .....RECEIVED
5. FMS .....ARRIVAL AND APPROACH SET
6. MDA / DA ..... SET
7. Landing data .....COMPUTE AND SET
8. V_{REF} ..... SET
9. Approach briefing..... COMPLETE

<<END>>

DESCENT TRANSITION

1. Altimeters ..... SET
2. WING and ENG ANTI-ICE ..... .AS REQUIRED

NOTE

Moving the ENG A/I switches from AUTO to ON or ON to AUTO when the Ice Detected message is displayed may cause the ENG Anti-Ice Fail Caution message to display.

NOTE

Evaluate Weather conditions at the airport with emphasis on the possibility of encountering icing conditions during the approach and missed-approach. If icing conditions are expected, ensure that Engine/Wing Anti-Ice are selected ON and the wings are verified as green (100°F minimum) on the Bleed/Anti-Ice synoptic prior to deploying flaps.

3. Engine instruments ..... MONITOR
4. CPCS ..... MONITOR
5. WINDSHIELD HEAT ..... AS REQUIRED
6. Cockpit/cabin/EXT LTS ..... AS REQUIRED

NOTE

LND lights switch on automatically when descending through 18,000 ft if remained ON during climb.

<<END>>

BEFORE LANDING

1. Cockpit displays ..... SET FOR LANDING

NOTE

EICAS should be displayed on both DU 1 and DU 3 for takeoff/landing phase of flight – Stacked EICAS or 1/4 window EICAS per pilot's discretion.

2. PARK BRAKE ..... OFF
3. Autobrakes ..... AS REQUIRED
4. Landing gear ..... DOWN / 3 GREEN
5. Flaps ..... LND
6. Airspeed ..... V_{REF} + 5 KT

NOTE

When winds are greater than 10 knots or wind gusts are reported, add half the steady headwind component plus full gust value up to a maximum of 20 kt to V_{REF}.
Landing distance calculations are based on crossing the threshold at V_{REF}. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10-knot overspeed.

7. EXT LTS ..... AS REQUIRED

<<END>>

GO AROUND (TWO-ENGINE)

1. TO/GA Button.....PRESS

NOTE

The A/T system, if engaged, automatically advances to T/O thrust, and the autopilot, if engaged, remains engaged and executes an automatic go-around. Target speed selected upon flaps lever position (AUTO mode) or speed bug (MAN mode). Missed approach is activated on FMS and NAV source automatically swaps to FMS if automatic swap from FMS to NAV occurred at beginning of the approach.

2. Airspeed.....V_{REF}
3. Thrust.....GO-AROUND THRUST (IF REQUIRED)

NOTE

If a go-around is performed due to balked landing (after touchdown), verify that speed brakes lever is retracted.

4. Flaps ..... 20°

Once go-around attitude and positive rate of climb are both established with flaps at 20°:

5. Landing gear .....RETRACT

NOTE

Only if aircraft touched down during a rejected landing - If landing gear is intentionally left extended, smoothly pull the parking brake handle up momentarily when safely airborne to manually command wheel despin. Failure to stop the wheels after lift off may result in a THRUST REV FAIL caution message.

At safe altitude:

6. Airspeed ..... V_{REF}+20 KT
7. Flaps ..... UP
8. Airspeed ..... V_{REF}+30 KT
9. Thrust ..... AS REQUIRED

<<END>>

AFTER LANDING

1. Cockpit/cabin EXT LTS ..... AS REQUIRED
2. Weather radar ..... STBY
3. Transponder ..... AS REQUIRED
4. WINDSHIELD HEAT ..... OFF
5. PROBES HEAT ..... AUTO
6. WING and ENG ANTI-ICE ..... AS REQUIRED
7. APU ..... AS REQUIRED
8. Flaps ..... AS DESIRED

NOTE

If icing conditions are encountered during the approach phase of flight with the flaps extended, do not raise the flaps above 10 degrees without a visual inspection for ice build up on the leading edge of the flaps. Ice build up on the leading edge of the flaps can interfere with raising the flaps to zero degrees and possibly cause a Flaps Jam caution CAS message.

When the flaps are set to 10 or UP after landing, the FCECU will initiate a post flight bit causing the Yaw Damper Off caution CAS message to display momentarily.

9. BTMS ..... MONITOR

After 3 minutes minimum with engine at idle:

Post MOD G25-20113: . END OF PROCEDURE

Pre MOD G25-20113:

10. Engine ITT vs. OAT limit for shutdown ..... CHECK

(Continued)

After 3 minutes minimum with engine at idle:

11. Engine ITT vs. OAT limit for shutdown.....CHECK

NOTE

Check ITT vs. OAT using the table below:

OAT (°C)	≤ 35	> 35 but ≤ 40	>40 but ≤ 45	>45
MAX ITT (°C)	638	620	604	589

CAUTION

IF ITT IS GREATER THAN THE VALUES LISTED AFTER 3 MINUTES WITH ENGINE AT IDLE, TURN OFF ENGINE GENERATOR IF THE APU IS RUNNING WITH THE APU GENERATOR ON AND ALLOW ENGINE TO IDLE FOR AN ADDITIONAL 3 MINUTES. IF ITT IS STILL ABOVE LIMITS, DRY MOTORING OF ENGINE FOR 3 MINUTES MUST BEGIN WITHIN 3 MINUTES AFTER ENGINE SHUTDOWN. SEE ENGINE DRY CRANKING PROCEDURE.

If ITT exceeds the limit.

12. APU BLEED AIR.....ON
13. Both ENG BLEED AIR.....OFF
14. Engines..... STABILIZE AT IDLE FOR 3 MINUTES MINIMUM
15. ITT..... MONITOR

(Continued)

If ITT does not decrease below the limit:

16. Affected engine(s) ....PERFORM ENGINE DRY CRANKING, page IV-63, page IV-63 FOR 3 MINUTES AFTER ENGINE SHUTDOWN

CAUTION

DRY MOTORING OF EACH ENGINE MUST BE PERFORMED WITHIN 3 MINUTES OF ITS RESPECTIVE SHUT-DOWN.

<<END>>

QUICK TURN

The Quick Turn checklist can be used instead of the ENGINE SHUT-DOWN checklist and the BEFORE STARTING ENGINES checklist when the airplane will remain on Engine Generator, APU, or External Electrical Power between flights.

("Respective" refers to one or both engines planned for shutdown.)

1. PARK BRAKE lever ..... SET
2. NWS..... DISCONNECT
3. Respective ENG BLEED AIR..... OFF
4. Thrust Levers ..... IDLE

NOTE

Idle for 3 minutes before shut-down (including taxi time)

5. Respective Engine FUEL CONTROLS..... OFF
6. Respective FUEL STBY PUMPs..... OFF & NOT ARM (R ON FOR APU)
7. Respective HYDRAULIC EMPs..... OFF & NOT ARM
8. BCN LTS .....OFF (if both engines shutdown)
9. SEAT BELT and NO SMOKE..... AS DESIRED

Before Engine Start:

10. Exterior..... DOORS SECURE AND GEAR PINS OUT
11. Electrical Power ..... AS REQUIRED
12. Fuel..... CHECK QTY, DISTRIBUTION & TYPE
13. STAB TRIM ..... SET
14. AILERON and RUDDER TRIM ..... SET 0
15. Altimeters..... SET
16. FMS .....INITIALIZED & PROGRAMMED
17. Landing Field Elevation..... SET
18. Performance / Weight and Balance ..... CALCULATE
19. Vspeeds.....CHECKED / SET
20. Crew Briefing ..... ACCOMPLISH
21. SEAT BELT and NO SMOKE.....ON

Proceed to ENGINE START Checklist

ENGINE SHUT-DOWN

1. PARK BRAKE lever ..... SET
2. NWS ..... DISCONNECT
3. EMERGENCY LTS OFF/ARM ..... NOT ARM
4. Both ENG BLEED AIR ..... OFF

NOTE

Idle for 3 minute before shut-down (including taxi time).

5. Thrust levers ..... IDLE
6. GUST LOCK ..... LOCKED

NOTE

Thrust levers must be in idle prior to engaging the gust lock.

7. Engine FUEL CONTROLS ..... OFF
8. BCN ..... OFF
9. Fuel STBY pump ..... OFF and NOT ARM

NOTE

Leave R STBY PUMP ON, if APU is running

10. Both HYD EMP ..... OFF and NOT ARM
11. WING and ENG ANTI-ICE ..... OFF
12. Oxygen shutoff ..... OFF
13. Passenger oxygen control supply ..... AS DESIRED
14. Therapeutic oxygen ..... OFF
15. Chocks ..... IN PLACE
16. PARK BRAKE ..... AS REQUIRED
17. APU STOP ..... PRESS
18. APU EGT and RPM ..... MONITOR

(Continued)

When APU RPM less than 5%:

19. APU MASTER ..... OFF

NOTE

1. APU EGT and RPM indications are displayed for 5 minutes after the APU RPM is less than 5% and the APU MASTER pushbutton is selected OFF, provided the APU ECU has a source of power.

2. At any time, if the APU MASTER pushbutton is selected OFF, APU immediately shuts down.

20. R FUEL STBY PUMP..... OFF
21. EXT LTS..... OFF

NOTE

The STBY BATT and both BATT switches must be ON to check oil quantity on the refuel-defuel panel. If it has been between five (5) and thirty (30) minutes since engine shutdown, leave the STBY BATT and both BATT ON and check the Oil Quantity before turning the STBY BATT and both BATT OFF.

22. APU Door..... VERIFY CLOSED
23. Oil Quantity .....CHECK

NOTE

Oil quantity can be checked on the Ground Services Synoptic or the refuel-defuel panel. Indications will appear two minutes after engine shutdown. The STBY BATT and both BATT switches must be ON to check oil quantity on the refuel-defuel panel.

(Continued)

24. Both BATT ..... OFF
25. STBY BATT ..... OFF
26. Aircraft ..... SECURE

NOTE

If the airplane will be un-powered greater than 48 hours, pulling CB-1 on the front of the emergency battery located in the left hand avionics rack behind the waste and water control panel will prevent battery depletion.

<<END>>

ALTERNATE NORMAL PROCEDURES

BLEED AIR OFF TAKEOFF

CAUTION

BLEED OFF TAKEOFF IS PROHIBITED DURING ICING CONDITIONS WHEN WING ANTI-ICE IS REQUIRED.

NOTE

At 1500 ft AGL both ENG bleed turn on automatically, then, Bleed Configuration caution message comes on until APU BLEED is selected to OFF.

Conditions:

1. FMS - PERF - TAKEOFF, ENG BLEED ..... SELECT OFF
2. APU BLEED AIR ..... ON

NOTE

When APU bleed is selected, the isolation valve opens and the both bleed air MPRSOV (Manifold Pressure Regulator Shut Off Valve) close, and indicate OFF although the pushbuttons are selected ON.

3. Both ENG BLEED AIR ..... ON (INDICATING OFF)
4. BLEED AIR ISOLATION ..... VERIFY OPEN

(Continued)

At 1500 ft AGL Bleed Configuration caution message comes on:

5. APU BLEED AIR ..... OFF
6. Both ENG BLEED AIR ..... VERIFY ON
7. BLEED AIR ISOLATION valve ..... VERIFY CLOSED
8. APU ..... AS REQUIRED

<<END>>

BEFORE STARTING ENGINES / ENGINE START - BATTERY POWER ONLY

Use this checklist in situations where the only electrical source available is the airplane's batteries and an air source is available from either the APU or an external air cart.

Accomplish this checklist immediately after the COCKPIT PRE-FLIGHT INSPECTION checklist.

If the APU is the source for engine start, expedite steps between APU start and starting of the first engine to reduce drain on the batteries.

1. Circuit breakers ..... CHECKED; ALL IN
2. Electrical Power ..... BOTH BATT and STBY BATT
3. Hydraulic Accumulators ..... CHECK
4. PARK BRAKE ..... SET
5. FIRE SYS TEST ..... PRESS

NOTE

Verify red light in fire handles, fuel control switches, and APU FIRE pushbutton and illumination of APU ARM / EMPTY pushbutton.

Verify that Fire/Bleed Test OK status message is displayed within 11 seconds.

6. FIRE Handles ..... IN
7. Engine FUEL CONTROLS ..... OFF

(Continued)

If the APU is used for engine start perform APU START (ON GROUND) *checklist.*

8. BCN LTS ..... ON
9. APU BLEED AIR or External Air ..... ON

CAUTION

RECOMMENDED INDICATED BLEED AIR PRESSURE TO INITIATE ENGINE START IS APPROXIMATELY 32 PSI BELOW 10,000 FT MSL AND APPROXIMATELY 26 PSI ABOVE 10,000 MSL. THE ENGINE CAN BE STARTED WITH PRESSURES LOWER THAN THESE BUT THE POSSIBILITY OF HOT START INCREASES.

MONITOR ITT CLOSELY DURING THE ENGINE START

10. Thrust Levers ..... IDLE
11. R engine FUEL CONTROL ..... ON
12. R FUEL STBY PUMP ..... ON

NOTE

STBY Pump On, R status message displays

13. R EMP HYD EMP ..... ON

NOTE

EMP HYD Pump On, R status message displays

14. Danger Areas ..... CLEAR

(Continued)

CAUTION

ABORT THE START BY TOGGLING THE FUEL CONTROL SWITCH TO OFF POSITION IF:

1. NO N_2 ROTATION.
2. N_2 FAILS TO REACH IDLE SPEED WITHIN ENGINE START TIME LIMITATIONS.
3. NO N_1 ROTATION BY 25 PERCENT N_2.
4. LIGHT-OFF DOES NOT OCCUR WITHIN 30 SECONDS OF START INITIATION.
5. N_1 OR N_2 STOPS ACCELERATING TO IDLE (HUNG START).
6. NO POSITIVE INDICATION OF OIL PRESSURE BY 30 PERCENT N_2.
7. ITT rises rapidly through maximum start limit of 650°C up to 40% N_2.
8. ANY UNUSUAL NOISE OR VIBRATION.
9. ATS VALVE FAILS TO CLOSE (SVO) SYMBOL IS ON AFTER ENGINE REACHED IDLE AND/OR Starter Fail On, L or Starter Fail On, R CAUTION MESSAGE DISPLAYED).
10. IF ANOTHER START IS ATTEMPTED –
    A. CLEAR ENGINE OF FUEL AND VAPOR BY ENGINE DRY CRANKING, page IV-63 PRIOR TO ATTEMPTING ANOTHER START.

(Continued)

B. DO NOT EXCEED STARTER DUTY CYCLE OF:

- THREE CONSECUTIVE START CYCLES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS AND MOTORING.
- A MAXIMUM OF 5 MINUTES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR MOTORING.

15. R ENG START/CRANK.....PRESS ONE SECOND
16. Engine Indications..... MONITOR

NOTE

As engine stabilizes at idle the right generator will come on line.

When engine is at idle:

17. R GEN..... VERIFY ON (LOAD, VOLT)
18. R FUEL STBY PUMP.....OFF, THEN ARM
19. R HYD EMP .....OFF,THEN ARM
20. R ENG ANTI-ICE ..... AS REQUIRED
21. Before Starting Engines Checklist ..... COMPLETE PRIOR TO STARTING SECOND ENGINE
22. Start the Left engine using the appropriate procedure.

<<END>>

ENGINE CROSS START ON GROUND

CAUTION

INSUFFICIENT BLEED AIR PRESSURE DURING ENGINE CROSS START MAY RESULT IN DAMAGE TO THRUST REVERSER SYSTEM OR HOT START. DO NOT INITIATE START UNLESS SPECIFIED BLEED AIR PRESSURE IS INDICATED AND STABLE. READ ENTIRE PROCEDURE BEFORE PERFORMING.

1. PARK BRAKE ..... SET
2. ENG BLEED AIR (Engine To Be Started) ..... OFF
3. ENG BLEED AIR (Operating Engine) ..... ON
4. ISOLATION Valve..... OPEN
5. FUEL CONTROL (Engine To Be Started) ..... RUN
6. Thrust Lever (Engine To Be Started)..... IDLE
7. FUEL STBY PUMP (Engine To Be Started) ..... ON
8. HYDRUALIC EMP (Engine To Be Started) ..... ON
9. Danger Areas ..... VERIFY CLEAR OF OTHER AIRCRAFT, EQUIPMENT OR PERSONNEL
10. Thrust Lever (Operating Engine)..... ADVANCE TO 85% N2

After 30 seconds:

11. Bleed Air Pressure:
    Below 10000 ft ..... VERIFY 32 PSI OR GREATER AND STABLE
    10000 ft or higher .... VERIFY 26 PSI OR GREATER AND STABLE

(Continued)

CAUTION

CLOSELY MONITOR ENGINE INDICATIONS AND BLEED AIR PRESSURE DURING START. BLEED AIR PRESSURE WILL DECREASE WHEN STARTER IS ENGAGED. ADVANCE OPERATING ENGINE THRUST LEVER IF REQUIRED TO MAINTAIN AT LEAST 22 PSI DURING START. IMMEDIATELY ABORT START WITH FUEL CUTOFF SWITCH IF ENGINE INDICATIONS ARE NOT NORMAL OR IF BLEED PRESSURE CANNOT BE MAINTAINED. IF START IS ABORTED, PERFORM ENGINE DRY CRANKING PROCEDURE PRIOR TO ANY SUBSEQUENT START ATTEMPT.

NOTE

The cyan L-R Engine Thrust Fault CAS message will appear during the cross start and will extinguish once the start is completed.

CAUTION

ABORT THE START BY TOGGLING THE FUEL CONTROL SWITCH TO OFF POSITION IF:

1. NO N_2 ROTATION.
2. N_2 FAILS TO REACH IDLE SPEED WITHIN ENGINE START TIME LIMITATIONS.
3. NO N_1 ROTATION BY 25 PERCENT N_2.

(Continued)

4. LIGHT-OFF DOES NOT OCCUR WITHIN 30 SECONDS OF START INITIATION.

5. N_1 OR N_2 STOPS ACCELERATING TO IDLE (HUNG START).

6. NO POSITIVE INDICATION OF OIL PRESSURE BY 30 PERCENT N_2.

7. ITT RISES RAPIDLY THROUGH MAXIMUM START LIMIT OF 650°C UP TO 40% N_2.

8. ANY UNUSUAL NOISE OR VIBRATION.

9. ATS VALVE FAILS TO CLOSE (SVO) SYMBOL IS ON AFTER ENGINE REACHED IDLE AND/OR Starter Fail On, L or Starter Fail On, R CAUTION MESSAGE DISPLAYED).

10. IF ANOTHER START IS ATTEMPTED –

A. CLEAR ENGINE OF FUEL AND VAPOR BY ENGINE DRY CRANKING, page IV-63 PRIOR TO ATTEMPTING ANOTHER START.

B. DO NOT EXCEED STARTER DUTY CYCLE OF:

- THREE CONSECUTIVE START CYCLES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS AND MOTORING.
- A MAXIMUM OF 5 MINUTES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR MOTORING.

(Continued)

12. START/CRANK (Engine To Be Started).....PRESS ONE SECOND

NOTE

Observe proper engine start sequence on the primary EICAS display, as follows:

- SVO (Starter Valve Open) symbol is on.
- N_2 rotation.
- IGN green symbol is on.
- Fuel flow increases
- N_1 rotation.
- IGN symbol is off.
- Make sure that N_1 rotation is indicated before N_2 reaches 25%.
- Make sure that oil pressure indication is provided before N_2 reaches 30%.
- N_1, N_2, FF and ITT indications are rising and stabilized at ground idle (N_1 is stabilized between 20% and 25%).
- Verify that hydraulic pressure in corresponding system is rising (expected at 12% - 15% N_2).
- IGN symbol is cleared before N_2 reaches 50%.
- SVO symbol is cleared before engine stabilized at ground idle.

13. Engine Indications..... MONITOR
14. Bleed Air Pressure ..... MONITOR
(Advance operating engine thrust lever if required to maintain at least 22 PSI while starter is engaged)

(Continued)

When engine start is complete:

15. Thrust Levers ..... IDLE
16. ISOLATION Valve..... CLOSE
17. ENG BLEED AIR..... BOTH ON
18. FUEL STBY PUMP ..... BOTH OFF AND ARM
19. HYDRUALIC EMP..... BOTH OFF AND ARM
20. Hydraulic Pressures ..... CHECK
21. Generators ..... VERIFY BOTH ON (LOADS, VOLTS)

Proceed to AFTER START Checklist.

<<END>>

ENGINE START USING GROUND AIR SOURCE

NOTE

If engine restarts are required between 15 and 180 minutes following an engine shutdown, dry motoring is required prior to initiating a normal start sequence in order to reduce thermal binding of the LP rotor. See ENGINE DRY CRANKING, page IV-63. Wait a minimum of 3 minutes before engine start. If the engine is not started within 40 minutes of Dry Cranking, and it has been less than 180 minutes since engine shutdown, Engine Dry Cranking must be repeated prior to engine start.

1. Cockpit displays ..... SET FOR ENGINE START
2. Start clearance ..... REQUEST
3. BCN LTS ..... ON
4. PARK BRAKE ..... SET
5. ENG and APU BLEED AIR ..... OFF

NOTE

PACK may be deselected in order to prevent unwanted air cart odors from entering the cabin.

6. PACK ..... AS REQUIRED
7. ISOLATION valve ..... OPEN

First engine:

8. Engine FUEL CONTROL ..... RUN
9. FUEL STBY PUMP ..... ON

NOTE

STBY Pump On, L or STBY Pump On, R status message comes on.

(Continued)

10. HYDRAULIC EMP ON .....ON

NOTE

STBY Pump On, L or STBY Pump On, R status message comes on.

11. Thrust levers .....IDLE
12. Ground air source hose attached to ATS inlet ..... VERIFY BLEED AIR 32 PSI MIN.
13. Danger Areas .....CLEAR

CAUTION

ABORT THE START BY TOGGLING THE FUEL CONTROL SWITCH TO OFF POSITION IF:

1. NO N_2 ROTATION.
2. N_2 FAILS TO REACH IDLE SPEED WITHIN ENGINE START TIME LIMITATIONS.
3. NO N_1 ROTATION BY 25 PERCENT N_2.
4. LIGHT-OFF DOES NOT OCCUR WITHIN 30 SECONDS OF START INITIATION.
5. N_1 OR N_2 STOPS ACCELERATING TO IDLE (HUNG START).
6. NO POSITIVE INDICATION OF OIL PRESSURE BY 30 PERCENT N_2.
7. ITT rises rapidly through maximum start limit of 650°C up to 40% N_2.
8. ANY UNUSUAL NOISE OR VIBRATION.

(Continued)

9. ATS VALVE FAILS TO CLOSE (SVO) SYMBOL IS ON AFTER ENGINE REACHED IDLE AND/OR Starter Fail On, L or Starter Fail On, R CAUTION MESSAGE DISPLAYED).

10. IF ANOTHER START IS ATTEMPTED –

A. CLEAR ENGINE OF FUEL AND VAPOR BY ENGINE DRY CRANKING, page IV-63 PRIOR TO ATTEMPTING ANOTHER START.

B. DO NOT EXCEED STARTER DUTY CYCLE OF:

- THREE CONSECUTIVE START CYCLES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS AND MOTORING.
- A MAXIMUM OF 5 MINUTES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR MOTORING.

NOTE

The engine start cycle incorporates an overtemperature start protection function that terminates a ground start if ITT limit is exceeded for 5 seconds.

(Continued)

14. START/CRANK .....PRESS ONE SECOND

NOTE

Observe proper engine start sequence on the primary EICAS display, as follows:

- SVO (Starter Valve Open) symbol is on.
- N_2 rotation.
- IGN green symbol is on.
- Fuel flow increases
- N_1 rotation.
- IGN symbol is off.
- Make sure that N_1 rotation is indicated before N_2 reaches 25%.
- Make sure that oil pressure indication is provided before N_2 reaches 30%.
- N_1, N_2, FF and ITT indications are rising and stabilized at ground idle (N_1 is stabilized between 20% and 25%).
- Verify that hydraulic pressure in corresponding system is rising (expected at 12% - 15% N_2).
- IGN symbol is cleared before N_2 reaches 50%.
- SVO symbol is cleared before engine stabilized at ground idle.

15. Engine indications ..... MONITOR

When engine at idle:

16. FUEL STBY PUMP ON ..... OFF

NOTE

STBY Pump On, L / STBY Pump On, R status message - out.

17. FUEL STBY PUMP OFF/ARM ..... ARM

(Continued)

18. HYDRAULIC EMP ON ..... OFF

NOTE

EMP HYD Pump On, L or EMP HYD Pump On, R status message - out.

19. HYDRAULIC EMP OFF/ARM ..... ARM
20. ENG ANTI-ICE ..... AS REQUIRED

NOTE

If OAT is less than 10°C and visible moisture select ENG ANTI-ICE to ON.

Second engine:

21. Repeat steps 8 through 20 for second engine.

When both engines at idle:

22. Hydraulic pressures ..... CHECK (3000 PSI)
23. PACK ..... AS REQUIRED
24. Both generators ..... VERIFY ON (LOAD, VOLTS)
25. Ground air source ..... DISCONNECT
26. ISOLATION valve ..... CLOSE
27. Both ENG BLEED AIR ..... ON

NOTE

ENG BLEED pushbutton illuminates OFF if APU bleed is selected to ON – on ground.

<<END>>

APU START USING EXTERNAL POWER

1. Preflight/Exterior Inspection ..... ACCOMPLISHED
2. EXT PWR .....ON
3. NAV light .....ON
4. FIRE SYS TEST.....PRESS (IF ENGINES OFF)

NOTE

Verify red light in fire handles, fuel control switches, and APU FIRE pushbutton and illumination of APU ARM / EMPTY pushbutton.
Verify that Fire/Bleed Test OK status message is displayed within 11 seconds.

5. R STBY PUMP ON.....ON
6. APU MASTER.....ON
7. APU START .....PRESS
8. APU GEN..... VERIFY ON, CHECK LOAD
9. BOTH BATT .....ON
10. APU BLEED AIR ..... AS REQUIRED

NOTE

APU bleed air is available 90 seconds after APU start is completed.

11. EXT PWR..... AS REQUIRED
12. Proceed to BEFORE STARTING ENGINES, page IV-14

<<END>>

ENGINE DRY CRANKING

WARNING

DO NOT PERFORM DRY CRANKING WITH THE AIRCRAFT'S FUEL PYLON ISOLATION VALVE CLOSED. THE FIRE HANDLES MUST BE IN.

CAUTION

DO NOT EXCEED THE AIR TURBINE STARTER DUTY CYCLE (1-80-10).

- THREE CONSECTIVE START CYCLES FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR CRANKING
- A MAXIMUM OF 5 MINUTES FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR CRANKING
- CRANK SEQUENCE IS LIMITED BY THE FADEC TO 300 SECONDS AND STOPS AUTOMATICALLY UNLESS STOPPED MANUALLY BY PILOT.

NOTE

Ground air source, APU or cross bleed air source can be used for dry cranking.

1. Fire Handles.....IN
2. Bleed air source.....SELECT ON
3. BLEED AIR ISOLATION.....OPEN
4. HYD EMP.....ON
5. Engine FUEL CONTROL.....OFF
6. ENGINE CRANK.....ON
7. Required Crank Time..... DETERMINE PER TABLE BELOW

(Continued)

Purpose	Time	Remarks
Before engine start to reduce thermal binding of the LP rotor.	Until N_2 reaches 21% or after 15 seconds, whichever comes first	Required before engine start if engine was previously shut down between 15 and 180 minutes ago. Engine can be started between 3 and 40 minutes after cranking.
After aborted engine start prior to next start attempt.	30 seconds	Required to clear engine of fuel and vapors.
Cool engine exhaust area after landing in hot weather conditions	3 minutes	Perform within 3 minutes of engine shut down. If both engines require cranking, keep one engine running until motoring is complete on the first engine, then shut down and motor the remaining engine.

8. Engine START/CRANK ..... START

After required crank time is achieved:

9. ENGINE CRANK ..... DEPRESS TO STOP
10. BLEED AIR ISOLATION ..... AS REQUIRED
11. HYD EMP ..... OFF

<<END>>

ENGINE MOTORING IN HOT WEATHER CONDITIONS (PRE MOD G25-20113)

This procedure applies to all landings, with or without thrust reversers operation, upon which ITT exceeded the temperature indicated in the table below:

After 3 minutes minimum with engine at idle:

1. Engine ITT vs. OAT limit for shutdown.....CHECK

NOTE

Check ITT vs. OAT using the table below:

OAT (°C)	≤ 35	> 35 but ≤ 40	>40 but ≤ 45	>45
MAX ITT (°C)	638	620	604	589

CAUTION

IF ITT IS GREATER THAN THE VALUES LISTED AFTER 3 MINUTES WITH ENGINE AT IDLE, TURN OFF ENGINE GENERATOR IF THE APU IS RUNNING WITH THE APU GENERATOR ON AND ALLOW ENGINE TO IDLE FOR AN ADDITIONAL 3 MINUTES. IF ITT IS STILL ABOVE LIMITS, DRY MOTORING OF ENGINE FOR 3 MINUTES MUST BEGIN WITHIN 3 MINUTES AFTER ENGINE SHUTDOWN. SEE ENGINE DRY CRANKING PROCEDURE.

If ITT exceeds limit:

2. APU BLEED AIR.....ON
3. Both ENG BLEED AIR.....OFF
4. Engines..... STABILIZE AT IDLE FOR 3 MINUTES MINIMUM
5. ITT ..... MONITOR

(Continued)

If ITT does not decrease below the limit:

CAUTION

DRY MOTORING OF EACH ENGINE MUST BE PERFORMED WITHIN 3 MINUTES OF ITS RESPECTIVE SHUT-DOWN.

6. Affected engine(s) .....PERFORM NORMAL SHUT-DOWN; see ENGINE SHUT-DOWN, page IV-44
7. Affected engine(s) ..... PERFORM DRY CRANKING FOR 3 MINUTES; see ENGINE DRY CRANKING, page IV-63
8. Complete ENGINE SHUT-DOWN procedure, page IV-44

<<END>>

OPERATING AT AN AIRPORT NOT IN FMS DATABASE

1. TERRAIN INHIBIT.....ON

NOTE

Failing to inhibit TAWS alerts triggers misleading ground proximity warnings before landing and after takeoff.

2. Manual Landing Field Elevation (LFE) ..... SET (SMC - UTIL - Cabin Pressure)

NOTE

CPCS LFE Manual status message comes on

Before takeoff:

3. Altimeter reading ..... Within 75 ft of runway elevation

<<END>>

HIGH ELEVATION AIRPORT OPERATION (ABOVE 8000 FT MSL)

The CPCS Warning Set High advisory message is set according to the following conditions:

The high-cabin altitude warning is set to 14,750 ft when aircraft altitude is below 25,000 feet and one of the following conditions exist:

1. In ground mode (ground, verify, takeoff, takeoff abort, or landing)
2. In climb mode and takeoff altitude above 8000 ft
3. In descent mode and landing altitude above 8000 ft

At this setting, the maximum limit for automatic passenger oxygen drop is 14,750 ft (instead of 13,500 ft for non high altitude airport operations).

NOTE

High elevation airport operation is relevant for the following scenarios:

1. Takeoff and landing field elevations above 8000 ft.
   Upon lift-off the cabin altitude descends until it reaches the climb auto schedule. The Cabin Pressure Controller (CPCS) maintains the cabin altitude at a maximum of 7000 ±100 ft until the aircraft descends more than 500 ft and aircraft altitude is less than 25,000 ft. Once this occurs, the system enters descent mode, where it ascends the cabin altitude to the landing field elevation.
2. Takeoff elevation above 8000 ft and landing at or below 8000 ft.
   In this case the controller descends the cabin altitude to 8000 ft and then descend the cabin altitude at a slower rate to the climb schedule, limiting the maximum cabin altitude to 7000±100 ft, until descent is detected.
   Once descent is detected the cabin climbs or descends to the landing field elevation if it is not already there.

(Continued)

3. Takeoff elevation at or below 8000 ft and landing above 8000 ft. In this case the controller allows the cabin altitude to correspond to the calculated climb schedule altitude until descent of 500 ft is detected, at which point the cabin rates to 7850 ft. The cabin altitude will then be maintained at 7850 ft until the aircraft altitude drops below 25,000 ft, at which point the cabin l continues to rate up to the selected landing altitude.

Takeoff:

NOTE

Use of oxygen by the flight crew while performing high-elevation operations at high-elevation airports or at elevations for which the flight crew is not acclimated is highly recommended. For operations at field elevations at and above 10,000 ft, use of oxygen is recommended.

1. Preferential runways, slope, head/tail wind conditions ..... CONSIDER
2. Acceleration ..... Expect slower than normal acceleration

Climb:

3. Desired cabin altitude for flight level ..... Verify cabin is pressurizing to desired cabin altitude
4. The cockpit crew shall use oxygen until the cabin altitude rate of change is zero and below 10,000 ft

Descent (LFE above 8000 ft):

1. Crew oxygen ..... AS REQUIRED

When the landing field elevation is greater than 9500 ft, one pilot shall use oxygen from the top of descent until landing and shutdown checklist is completed.

(Continued)

On approach, landing and rollout:

2. True Airspeed / groundspeed..... MONITOR

CAUTION

BE AWARE OF NOSE AND MAIN LANDING GEAR GROUND SPEED LIMITATION. GROUND SPEED AMPLIFIED BY TAILWIND CONDITIONS COULD EXCEED MAXIMUM TIER SPEED ON LANDING.

3. Thrust reverser spool-up times .....Expect slower than normal

<<END>>

SINGLE ENGINE GROUND OPERATIONS

Single engine ground operations may be performed using either engine for electrical and hydraulic power and opposite HYDRAULIC EMP for hydraulic power. APU operation is recommended for increased ECS performance, electrical back-up and as the source of bleed air for starting the opposite engine during taxi. Three procedures are available: SINGLE ENGINE TAXI BEFORE TAKEOFF, for departing the parking area on one engine for flight or for repositioning the aircraft on the airfield; TAXI ENGINE START, for starting the remaining engine prior to takeoff after departing the parking area and SINGLE ENGINE TAXI AFTER LANDING, which is for use after landing to facilitate to a quick turn or for flight termination. “Respective” in these procedures indicates an engine that is to be started or shut down.

NOTE

If engine dry motoring due to thermal binding from previous shutdown is required, it is recommended that the ENGINE DRY CRANKING procedure is accomplished prior to beginning single engine taxi operations.

CAUTION

IF APU IS NOT AVAILABLE FOR ENGINE START, ENGINE CROSS START ON GROUND OR ENGINE DRY CRANKING PROCEDURE IS TO BE ACCOMPLISHED WITH PARK BRAKE SET IN A LOCATION WHERE HIGH ENGINE POWER SETTINGS CAN BE SAFELY CONDUCTED. ENSURE AREA BEHIND AIRCRAFT IS CLEAR BEFORE ADVANCING POWER FOR CROSS-BLEED START OR DRY MOTORING.

SINGLE ENGINE TAXI BEFORE TAKEOFF

1. Desired engine for taxi ..... OPERATING

NOTE

If APU will be used with right engine shutdown, right FUEL STBY PUMP must remain ON until right engine is started. STBY Pump On, R status message is displayed.

2. Operating engine FUEL STBY PUMP ..... OFF then ARM

NOTE

STBY Pump On, L or STBY Pump On, R (unless APU is operating with right engine shut down) status message clears.

3. Operating engine HYDRAULIC EMP ..... OFF then ARM

NOTE

EMP HYD Pump On, L or EMP HYD Pump On, R status message clears.

4. Operating ENG ANTI-ICE ..... AS REQUIRED

NOTE

If OAT is 10°C or below and visible moisture in any form is present, select ENG ANTI-ICE to ON.

5. APU (if available) ..... OPERATING
   a. APU GEN ..... ON
   b. APU BLEED AIR ..... ON
6. Operating engine generator ..... VERIFY ON (LOAD, VOLTS)
7. Non-operating ENG BLEED ..... OFF
8. DOORS ..... ALL CLOSED
9. Cockpit displays ..... SET FOR TAXI

(Continued)

10. Non-operating engine HYDRAULIC EMP ..... ON

NOTE

EMP HYD Pump On, L or EMP HYD Pump On, R status message comes on.

11. Both hydraulic system pressures ..... CHECK (3000 PSI)

NOTE

Do not check flight controls or deploy speed brakes if flaps are in transit using only left HYDRAULIC EMP.

12. NWS ..... CONNECT
13. TAXI LTS ..... ON
14. Transponder ..... AS REQUIRED
15. Brakes and steering ..... CHECK
16. Fuel balance ..... MONITOR

NOTE

If there is fuel in the center tank and the wing tanks are not full, right engine start may be required to balance fuel if APU and left engine are operating.

(Continued)

If fuel balance is required:

a. FUEL XFLOW ..... OPEN

NOTE

Fuel XFLOW Valve Open status message will come on. CAS will change to Fuel XFLOW Valve Open caution message 5 minutes after valve has been selected open.

b. "Heavy" tank FUEL STBY PUMP ..... ON

NOTE

STBY Pump On, L or STBY Pump On, R (already on if APU is operating with right engine shut down) status message comes on.

When fuel balance is achieved:

c. FUEL XFLOW ..... CLOSE

d. "Heavy" tank FUEL STBY PUMP ..... OFF and ARM

NOTE

STBY Pump On, L or **STBY Pump On, R** (unless APU is operating with right engine shut down) status message clears.

When ready to start second engine:

GO TO ..... TAXI ENGINE START

<<END>>

TAXI ENGINE START

NOTE

Start respective engine to allow at least 3 minutes for sufficient warm-up and system checks before takeoff.

NOTE

If APU is not available for engine start, perform ENGINE CROSS START ON GROUND procedure.

CAUTION

IF ENGINE CROSS START ON GROUND PROCEDURE IS REQUIRED, ACCOMPLISH PROCEDURE WITH PARKING BRAKE SET IN A LOCATION THAT IS SAFE TO ADVANCE OPERATING ENGINE POWER TO APPROXIMATELY 65% N1. VERIFY THAT AREA BEHIND AIRPLANE IS CLEAR BEFORE INCREASING THRUST ON THE RUNNING ENGINE. COORDINATION WITH ATC MAY BE REQUIRED.

For respective engine:

1. Thrust lever ..... IDLE
2. Engine FUEL CONTROL ..... RUN
3. FUEL STBY PUMP ..... ON

NOTE

STBY Pump On, R or STBY Pump On, L status message is displayed.

(Continued)

4. Bleed air pressure.....CHECK

CAUTION

RECOMMENDED INDICATED BLEED AIR PRESSURE TO INITIATE ENGINE START IS APPROXIMATELY 32 PSI BELOW 10,000' MSL AND APPROXIMATELY 26 PSI ABOVE 10,000' MSL. THE ENGINE CAN BE STARTED WITH PRESSURES LOWER THAN THESE BUT THE POSSIBILITY OF A HOT START INCREASES. MONITOR ITT CLOSELY DURING ENGINE START.

5. Danger areas..... CLEAR

CAUTION

ABORT THE START BY TOGGLING THE FUEL CONTROL SWITCH TO OFF POSITION IF:

1. N_2 FAILS TO REACH IDLE SPEED WITHIN ENGINE START TIME NO N_2 ROTATION.
2. LIMITATIONS.
3. NO N1 ROTATION BY 25 PERCENT N_2.
4. LIGHT-OFF DOES NOT OCCUR WITHIN 30 SECONDS OF START INITIATION.
5. N_1 OR N_2 STOPS ACCELERATING TO IDLE (HUNG START)
6. NO POSITIVE INDICATION OF OIL PRESSURE BY 30 PERCENT N_2.
7. ITT RISES RAPIDLY THROUGH MAXIMUM START LIMIT OF 650°C UP TO 40% N_2.

(Continued)

8. ANY UNUSUAL NOISE OR VIBRATION.
9. ATS VALVE FAILS TO CLOSE (SVO SYMBOL IS ON AFTER ENGINE REACHED IDLE AND / OR Starter Fail On, L OR Starter Fail On, R CAUTION MESSAGE DISPLAYED).
10. IF ANOTHER START IS ATTEMPTED –
    a. CLEAR ENGINE OF FUEL AND VAPOR BY ENGINE DRY CRANKING, page IV-63 PRIOR TO ATTEMPTING ANOTHER START.
    b. DO NOT EXCEED STARTER DUTY CYCLE OF:
       - THREE CONSECUTIVE START CYCLES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS AND MOTORING.
       - A MAXIMUM OF 5 MINUTES, FOLLOWED BY A COOLING PERIOD OF 15 MINUTES PRIOR TO ADDITIONAL STARTS OR MOTORING.

NOTE

The engine start cycle incorporates an overtemperature start protection function that terminates a ground start if ITT limit is exceeded for 5 seconds.

(Continued)

6. START /CRANK ..... PRESS ONE SECOND
7. Engine indications ..... MONITOR

NOTE

Observe proper engine start sequence on the primary EICAS display, as follows:

- **SVO** (Starter Valve Open) symbol is on.
- N_2 rotation.
- **IGN** green symbol is on.
- Fuel flow increase.
- N_1 rotation.
- **IGN** symbol is off.
- Make sure N_1 rotation is indicated before N_2 reaches 25%.
- Make sure the oil pressure indication is provided before N_2 reaches 30%.
- N_1, N_2, FF and ITT indications are rising and stabilized at ground idle (N_1 is stabilized between 20% and 25%).
- Verify the hydraulic pressure in corresponding system is rising (expected at 12% -15% N_2).
- **IGN** symbol is cleared before N_2 reaches 50%.
- **SVO** symbol is cleared before engine stabilized at ground idle.

When engine is at idle:

8. FUEL STBY PUMP ..... OFF then ARM

NOTE

STBY Pump On, L or STBY Pump On, R status message clears.

9. HYDRAULIC EMP ..... OFF then ARM

NOTE

EMP HYD Pump On, L or EMP HYD Pump On, R status message clears.

(Continued)

10. Hydraulic system pressures ..... CHECK (3000 PSI)
11. ENG ANTI-ICE ..... AS REQUIRED

NOTE

If OAT is 10°C or below and visible moisture in any form is present, select ENG ANTI-ICE to ON.

12. Engine generator..... VERIFY ON (LOAD, VOLTS)

NOTE

A/C S/N 2001 – 2011: If second generator does not come on-line after engine start and **GEN FAIL** caution message comes on, deselect APU GEN and then press RESET.

13. Both ENG BLEED AIR .....ON

NOTE

ENG BLEED pushbutton illuminate OFF if APU bleed is selected to ON – on ground.

14. APU / APU BLEED AIR ..... AS REQUIRED
15. FLAPS.....SET FOR TAKEOFF (10° or 20°)
16. Flight controls / speed brakes ..... CHECK / RETRACT
17. Trims .....SET

NOTE

The STAB trim should be set according to the tables in Figure 5-45 for flaps – 20, Figure 5-46 for flaps – 10, and Figure 10-5-2 for flaps – 0. When programmed with the correct ZFWCG and fuel load, the FMS Takeoff Performance page will provide the correct STAB trim setting from the AFM. If the resulting STAB trim setting is slightly outside green band, move the setting just inside the green band.

(Continued)

18. Thrust reversers.....CHECK
19. Flight instruments / NAV sensors.....CHECK

GO TO..... TAXI/BEFORE TAKEOFF CHECKLIST

<<END>>

SINGLE ENGINE TAXI AFTER LANDING

1. AFTER LANDING checklist..... COMPLETE
2. APU (if available) ..... START
   a. APU BLEED AIR ..... ON (when available)

NOTE

APU BLEED AIR is not available until 90 seconds after APU start. Selecting APU BLEED AIR ON before it is available will cause the Bleed Configuration caution CAS message to come on.

For respective engine:

3. ENG BLEED AIR.....OFF
4. Thrust Lever .....IDLE

After 3 minutes minimum with engine at idle:

Post MOD G25-20113: Proceed to Step 6

Pre MOD G25-20113:

5. Engine ITT vs. OAT limit for shutdown ..... CHECK

NOTE

Check ITT vs. OAT using the table below:

OAT (°C)	≤ 35	> 35 but ≤ 40	>40 but ≤ 45	>45
MAX ITT (°C)	638	620	604	589

(Continued)

CAUTION

IF ITT IS GREATER THAN OR EQUAL TO THE VALUES LISTED AFTER 3 MINUTES WITH ENGINE AT IDLE, TURN OFF ENGINE GENERATOR AND ALLOW ENGINE TO IDLE FOR AN ADDITIONAL 3 MINUTES. IF ITT IS STILL ABOVE LIMITS, DRY MOTORING OF ENGINE FOR 3 MINUTES MUST BEGIN WITHIN 3 MINUTES AFTER ENGINE SHUTDOWN. SEE ENGINE DRY CRANKING PROCEDURE.

NOTE

Single engine taxi is not recommended if ITT is greater than or equal to the values listed because of dry motoring requirement within 3 minutes of shutdown.

6. HYDRAULIC EMP .....ON

NOTE

EMP HYD Pump On, L or EMP HYD Pump On, R status message comes on.

7. Engine FUEL CONTROL ..... OFF

NOTE

If APU is to be operated with right engine shut down, right FUEL STBY PUMP must remain operating. STBY Pump On, R is displayed.

8. FUEL STBY PUMP .....OFF and NOT ARM

(Continued)

When taxi is complete:

9. PARK BRAKE ..... SET
10. NWS ..... DISCONNECT
11. HYDRAULIC EMP (on shut down engine) ..... OFF and NOT ARM
12. SEAT BELT / NO SMOKE ..... AS DESIRED
13. MED ..... CLEAR / OPEN

WARNING

- DO NOT ALLOW PASSENGERS OR OTHER PERSONNEL TO ENTER OPERATING ENGINE DANGER AREAS.
- DO NOT OPEN EXTERNAL BAGGAGE DOOR WITH LEFT ENGINE OPERATING.

14. Engine dry motoring ..... WITHIN 3 MINUTES OF SHUTDOWN IF REQUIRED

Will one engine remain operating?

YES ..... GO TO QUICK TURN CHECKLIST
NO ..... GO TO ENGINE SHUT-DOWN OR QUICK TURN CHECKLIST

<<END>>

TRAFFIC PATTERN

TAXI BACK

1. LDG and STROBE LTS ..... OFF
2. Flaps ..... SET FOR TAKEOFF (10° or 20°)
3. Brake temps ..... CHECK
4. Transponder ..... SET
5. FMS PERF INIT ..... SET
6. FMS Takeoff data ..... SET
7. Vspeeds ..... CHECKED/SET

NOTE

If Vspeeds are displayed, any change of flap setting causes the Vspeeds to be deselected from display.

8. Trims (3) ..... SET

NOTE

The STAB trim should be set according to the tables in Figure 5-45 for flaps – 20, Figure 5-46 for flaps – 10, and Figure 10-5-2 for flaps – 0. When programmed with the correct ZFWCG and fuel load, the FMS Takeoff Performance page will provide the correct STAB trim setting from the AFM. If the resulting STAB trim setting is slightly outside the green band, move the setting just inside the green band.

9. Thrust mode ..... VERIFY T/O, CHECK POINTERS, CONFIRM RATING
10. Flight Instruments ..... CHECK / SET
11. FCP and flight directors ..... SET/CONFIRM

(Continued)

12. Autobrakes ..... RTO

NOTE

Autobrake RTO status message comes on when RTO mode selected.

13. Forward pocket door (if installed)..... VERIFY LATCHED OPEN
14. Crew briefing .....COMPLETED

NOTE

Accomplish takeoff briefing if not previously accomplished. Brief changes to runway, departure SID, ATC clearance, etc as required.

LINEUP

1. GUST LOCK ..... VERIFY UNLOCKED
2. Controls.....VERIFY FREE MOVEMENT
3. T/O box ..... CONFIRM
4. WX radar ..... AS REQUIRED
5. ENG and WING ANTI-ICE ..... AS REQUIRED
6. LDG and STROBE LTS.....ON
7. EICAS ..... CHECKED

When cleared for takeoff:

8. Runway heading ..... CONFIRM
9. PROBE HEAT ..... OVRD IF ICING CONDITIONS EXIST

WARNING

Failure to select PROBES HEAT to OVRD when icing conditions exist can result in loss of any or all airspeed indications at any time during the takeoff roll. If airspeed indication is lost due to ice contamination with the PROBES HEAT in AUTO, normal indications should return shortly after becoming airborne.

(Continued)

NOTE

Icing conditions on the ground and for takeoff exist when the Static Air Temperature (SAT) is 10°C (50°F) or below, and visible moisture in any form is present (such as clouds, fog with visibility of one mile or less, rain, snow, sleet and ice crystals). Icing conditions also exist when the SAT is 10°C (50°F) or below when operating on ramps, taxiways or runways where surface snow, ice, standing water, or slush are present. Limit the use of OVRD to thirty (30) seconds on the ground.

Probe Heat operation in OVRD mode on ground for more than 30 seconds may result in the following:

- SA/SAT/TAT will quickly rise to out of range indications
- ACS Default Mode CAS message
- TCAS FAIL appears on HSI and MAP
- Windshear Fail CAS message
- TCAS Fail CAS message
- TURB FAIL appears on HSI and MAP.

If an airspeed indication is lost during takeoff roll, airspeed may still be valid on the other PFD or ISI. Accurate ground speed (GS) will still be displayed on both PFDs.

AFTER TAKEOFF

1. Landing gear lever ..... UP

At V_{SE}-10 minimum and accelerating:

2. Flaps ..... AS REQUIRED
3. Climb thrust ..... SET(green CLB symbol)
4. TAXI light ..... OFF
5. PROBE HEAT ..... AUTO

TRAFFIC PATTERN

1. Landing data ..... COMPUTE AND SET
2. AUTOBRAKES ..... AS REQUIRED
3. Forward pocket door (if installed) ..... VERIFY LATCHED OPEN
4. Crew briefing ..... COMPLETED

BEFORE LANDING

1. Landing gear ..... DOWN/3 GREEN
2. Flaps ..... LAND
3. Landing clearance / TAXI Light ..... RECEIVED/ON

COLD WEATHER OPERATIONS

COLD WEATHER OPERATION REQUIRES FORETHOUGHT AND CAREFUL PREPARATION. PRIOR TO PERFORM THE FOLLOWING COLD WEATHER CHECK-LIST, THE PILOT SHOULD REVIEW THE COLD WEATHER OPERATIONS BRIEFING HEREIN AND THE GENERAL GUIDANCE BELOW.

General guidance for preparing the airplane for flight after a prolonged cold soak in temperatures less than -20 degrees C:

1. Use a GPU to assist the batteries for APU start.
2. Use of preheat capability if available to warm the avionics in the nose compartment.
3. Warm the cabin to +15 deg C temperature with the APU and Pack running and MED closed.

WARNING

If closing the MED to assist in heating or cooling the aircraft interior, verify the OFV valve is open and clear of obstruction.

4. Once everything is warmed up, if spurious indications, faults or failures have occurred, during power up, shut down to a "black" airplane and power back up to reboot and clear these spurious indications, faults or failures.

A. PRE-FLIGHT

1. All protection covers..... REMOVED
2. Wheels..... CHOCKED
3. PARK BRAKE ..... OFF
4. All surfaces ..... CHECK FREE FROM FROST, ICE OR SNOW
5. Heavy accumulation of snow ..... MANUALLY REMOVE

(Continued)

NOTE

Check control balance cavities for drainage after snow removal as puddles of water may refreeze in flight.

6. APU and engine inlet .....CHECK CLEAR OF IMPACTED ICE OR SNOW
7. Fuel tank vents..... CHECK FREE OF ICE OR SNOW
8. Pitot heads and static ports and AOA vanes .....CLEAR OF ICE
9. Landing gear (including proximity switches) ..... CHECKED
10. Nose strut service ..... CHECK
11. Air conditioning inlets and exits.....CLEAR OF ICE
12. Batteries.....VERIFY INSTALLED
13. Complete all checks up to ENGINE START, page IV-19 prior to deicing to prevent time loss after deicing completed

B. DE-ICING PROCEDURE

WARNING

1. DE-ICING FLUID MAKES ALL SURFACES SLIPPERY. WORK CAUTIOUSLY TO AVOID PERSONNEL INJURY.

2. IF IN DOUBT, PERFORM A VISUAL INSPECTION AND IF NECESSARY, REPEAT THE DE-ICING PROCEDURE PRIOR TO TAKEOFF.

CAUTION

1. ANY TIME THE RECOMMENDED HOLD-OVER TIME IS EXCEEDED, A PRE-TAKEOFF INSPECTION IS REQUIRED.

2. REFER TO HOLD-OVER TIME(S) TABLES FOR TYPE I, II, III AND TYPE IV FLUIDS. THE TIME OF PROTECTION WILL BE SHORTENED IN HEAVY WEATHER CONDITIONS.

(Continued)

3. HEAVY PRECIPITATION RATES OR HIGH MOISTURE CONTENT, HIGH WIND VELOCITY OR JET BLAST MAY REDUCE HOLDOVER TIME BELOW THE LOWEST TIME STATED IN THE RANGE. HOLDOVER TIME MAY BE REDUCED WHEN AIRPLANE SKIN TEMPERATURE IS LOWER THAN AMBIENT TEMPERATURE.
4. TYPE I, II, III AND IV FLUIDS ARE NOT COMPATIBLE AND MAY NOT BE MIXED. ADDITIONALLY, MOST MANUFACTURERS PROHIBIT MIXING OF BRANDS WITHIN A TYPE.
5. CARE MUST BE EXERCISED TO ENSURE THAT ALL MELTED PRECIPITATION IS REMOVED FROM THE AIRCRAFT TO PREVENT RE-FREEZING.
6. USE TYPE II, III AND IV ANTI-ICING FLUIDS WITH EXTREME CAUTION NEAR ENGINE INTAKES AND EXHAUSTS TO AVOID ACCUMULATIONS WHICH COULD BE INGESTED AND IGNITED WHEN STARTING ENGINES.
7. IF ACCUMULATION IS EVIDENT, REMOVE BEFORE STARTING.
8. NEVER RISK DAMAGE TO THE AIRCRAFT BY SCRAPING OR CHIPPING ICE. EXERCISE CAUTION WHEN BRUSHING AROUND ANTENNAS, WINDOWS, FLIGHT CONTROLS, PROBES, VANES AND SIMILAR OBSTRUCTIONS.

(Continued)

NOTE

If brakes are covered with snow or ice, use hot air; avoid chemical de-icing fluid.

1. STAB trim ..... UP 12º
2. PARK BRAKE ..... ON
3. Both Engine Bleeds ..... OFF

NOTE

If operational requirements dictate operation of the engines during the de-icing process, it is recommended the engines be operated at ground idle thrust with the engine bleeds turned off. Additionally, take actions to ensure de-icing fluid is not directed at the engine inlet area.

4. APU ..... OFF
5. APU Door ..... VERIFY CLOSED

NOTE

De-icing and anti-icing fluids are not intended for use in removing snow deposit. Snow is best removed by mechanically sweeping or brushing it from the aircraft structure.

6. DITCH ..... ON (outflow valve closed)
7. All doors ..... CLOSED
8. Communication with ground crew (“Snow-Man”) ..... ESTABLISH
9. De-Icing ..... INITIATE

(Continued)

10. De-Icing procedure parameters ..... NOTE

a. Type of procedure: Deicing only ____ Anti-Icing only ____
De-icing AND Anti-icing ____
b. Type of fluid used: De-Icing: TYPE I ____
Anti-Icing: TYPE II ____ TYPE III ____ TYPE IV ____
c. Mixture ratio%: ____/____
d. Time since last de-icing procedure: _____ GMT
or - Anti-icing started: _____ GMT
e. OAT _____ °C
f. Type of precipitation:
Active frost ____ Rain on cold soaked wing ____
Freezing fog ____ Freezing rain ____ Light freezing rain ____
Snow/snow grains ____ Other ____
g. Remarks: _____
h. Holdover time CALCULATE

NOTE

Hold-over Time: _____ /
Expiration Time: _____ GMT

11. Expiration Time ..... NOTIFY TOWER

C. SYSTEMS START

1. APU ..... START
2. DITCH ..... OFF
3. APU BLEED AIR ..... ON

NOTE

Avoid powering up systems if cockpit temperature is below 10°C.

(Continued)

D. ENGINES START

1. Engine oil temperature ..... CHECK ABOVE -40°C

CAUTION

1. DO NOT START THE ENGINE(S) WHEN THE OIL TEMPERATURE IS BELOW -40°C). WARM UP OIL PRIOR TO ENGINE START.

2. N_1 rotation ..... CHECK MANUALLY
3. Perform ENGINE STARTING, page IV-14

E. AFTER ENGINES START

1. DO NOT ADVANCE THRUST LEVER UNTIL OIL TEMPERATURE REACHES ABOVE +5°C
2. Engine Oil Pressure ..... CHECK

NOTE

During cold weather starts, oil pressure may temporarily exceed maximum pressure limits until oil temperature rises. At low ambient temperatures, a temporary high pressure above maximum limits may be tolerated but takeoff should be delayed until pressure drops within normal limits.

3. Engines anti-ice..... CHECK / AS REQUIRED

NOTE

On selection, observe A/I green label in ITT dials, ENG Anti-Ice ON status message is displayed and ITT rise.

4. APU BLEED AIR ..... OFF
5. Flaps ..... CHECK FOR NORMAL OPERATION THEN RETRACT
6. PERFORM AFTER START (page IV-26) PROCEDURE

F. TAXI

CAUTION

1. DO NOT TAKE OFF WITH BRAKE TEMPERATURE BELOW 10°C ON CONTAMINATED RUNWAYS. TAXI AT SLOWEST POSSIBLE SPEED; AVOID PUDDLES AND SLUSH AS MUCH AS POSSIBLE; USE NWS. SMOOTHLY; INCREASE DISTANCE BEHIND PRECEDING AIRPLANE.
2. AVOID SETTING THE PARKING BRAKE FOR ANY LENGTH OF TIME.
3. AVOID USING IDLE REVERSE THRUST DURING TAXI ON SNOW OR SLUSH COVERED TAXIWAYS.
4. TAXIWAYS AND RUNWAYS LIGHTS MAY BE COVERED WITH SNOW AND POORLY VISIBLE.
5. RIDE THE BRAKES DURING TAXI IN ORDER TO WARM THE BRAKES TO 10° - 90°. THIS PREVENTS ICE ACCUMULATION ON THE BRAKES.

NOTE

When stopped, perform several maximum brake applications.

(Continued)

As soon as possible after engine start:

1. Taxi ..... INITIATE
2. NWS ..... EXERCISE IN BOTH DIRECTIONS
3. Brakes ..... OPERATE TO BUILD UP HEAT
4. Perform TAXI/BEFORE TAKEOFF (page IV-27)

In freezing fog conditions:

5. PERFORM ICE SHEDDING ON GROUND, page IV-98

G. BEFORE TAKEOFF

WARNING

IF IN DOUBT, THE PIC MUST CONDUCT A HANDS-ON INSPECTION 5 MINUTES MAXIMUM PRIOR TO TAKEOFF OR HAVE THE AIRCRAFT DE-ICED AGAIN PRIOR TO TAKEOFF.

CAUTION

1. FLAPS SHOULD BE EXTENDED PRIOR TO LINE UP TO AVOID SNOW AND ICE ACCUMULATION DURING TAXI.
2. DO NOT TAKE OFF WITH BRAKE TEMPERATURE BELOW 10° ON CONTAMINATED RUNWAYS.

1. Flaps ..... EXTEND AS REQUIRED
2. Flight controls sweep ..... PERFORM
3. ENG ANTI-ICE ..... CHECK / AS REQUIRED

NOTE

On selection observe A/I green label in N_1 dials, ENG Anti-Ice On, L status message is displayed and ITT rises.

4. WING ANTI-ICE ..... CHECK / AS REQUIRED
5. Perform final ice inspection
6. PERFORM TAXI/BEFORE TAKEOFF, page IV-27
7. PERFORM LINE UP, page IV-29

H. DESCENT (Below 30,000 ft)

1. WATER SYSTEM..... PURGE
   a. Water and Waste Panel (WWIP) - Main page (1/3) - PURGE STATE..... VERIFY AVAILABLE
   b. PURGE WATER SYS .....SELECT
   c. CONFIRMATION QUESTION.....SELECT YES
   d. PURGE STATE .....VERIFY PURGING (FLASHING)

NOTE

1. During purge cycle the hot water heater will be in state “OFF”, and its soft button will not be displayed.
2. At any time “STOP WATER PURGE” can be selected to stop the purging. Confirmation question for canceling the purging will be displayed for 30 seconds, before returning to MAIN PAGE if there is no user action.
3. PURGE STATE will show PURGING for additional 30 seconds after water level displays empty.

   e. When Purging completed - PURGE STATE.....VERIFY AVAILABLE

NOTE

1. If water tank is empty - Heaters will be OFF and option to turn heaters to on is no longer available.
2. If water tank is greater than 10% heaters will be ON.

2. WATER level .....VERIFY EMPTY

I. AFTER LANDING

1. If WATER SYSTEM was not purged in flight and forecasted temperature during layover is below freezing .....PURGE WATER

NOTE

Water can be purged through WWIP or Manually through WWS Panel. For WWIP operation see H. DESCENT (Below 30,000 ft), page IV-96.

<<END>>

BACK
TOC Local
TOC Main

ICE SHEDDING ON GROUND

NOTE

1. This procedure ensures that no ice is present on engine compressor 1ST stage and guide vanes through ice-shedding, when the ground temperature is below -6°C
2. Freezing fog (FZFG on METAR) is defined by a ground temperature below 0°C and horizontal visibility less than 1000 m.

Ground operations and taxiing:

CAUTION

BEWARE OF JET BLAST BEHIND AIRCRAFT.

As practicable, but at intervals of no more than 30 minutes:

1. Both thrust lever(s) (one at a time).....ADVANCE TO 70% N_1 FOR 10 SECONDS MINIMUM
2. Engine parameters.....MONITOR
3. Thrust lever(s).....IDLE

NOTE

Vibration and rumbling noises may occur when ice sheds.

(Continued)

Before takeoff (at hold-short or lined-up on runway if possible):

4. Thrust levers (both).... ADVANCE TO 70% N_1 FOR 10 SECONDS MINIMUM
5. Engine parameters..... MONITOR
6. Thrust levers ..... IDLE

NOTE

Vibration and rumbling noises may occur when ice sheds.

<<END>>

ICE SHEDDING IN FLIGHT

If engine vibration/rumbling noise if felt due to icing and if ice-shedding appears to be necessary:

1. Right engine thrust lever .....SET MAX CRUISE
2. Left engine thrust lever..... RETARD QUICKLY TO IDLE FOR 5 SECONDS

NOTE

TCM compensates for asymmetric thrust.

3. Left engine thrust lever.....ADVANCE TO 90% N_1
4. Left engine thrust lever.....SET CRUISE THRUST
5. Repeat steps 1 through 4 for right engine
6. Both engines .....THRUST AS REQUIRED

<<END>>

ICING CONDITIONS ABOVE 35,000 FT

ICING GENERAL

A. Icing conditions exist when either:

- TAT is 10°C or below and SAT is above -40°C and visible moisture is present in any form

OR

- Visible cues (icing on wings leading edges, winglets, windshields) are present

OR

- Ice Detected, L or Ice Detected, L-R (Pre MOD G25-10074: Caution; Post MOD G25-10074: Caution or Advisory) message is displayed

If any of the icing conditions are encountered above 35,000ft:

1. L and R WING ANTI-ICE.....ON
2. L and R ENG ANTI-ICE.....ON

CAUTION

AVAILABLE THRUST IS REDUCED WITH THE WING ANTI-ICE SYSTEM OPERATING ABOVE 35,000 FT. THIS MAY PREVENT CONTINUED FLIGHT AT CURRENT ALTITUDE. MONITOR AIRSPEED AND ANGLE OF ATTACK TO DETERMINE IF A DESCENT IS NECESSARY.

3. Airspeed.....MAINTAIN AT OR ABOVE $0.8M_i$

If AOA increases above 0.45 and/or Mach decreases below $0.75M_i$:

4. Descend and accelerate to decrease AOA below 0.45

If Icing conditions persist and airplane performance is decreasing:

5. Continue descent to a lower altitude
6. Exit icing conditions as soon as practical if aircraft performance continues to deteriorate

When out of icing conditions:

7. Both WING ANTI-ICE.....OFF
8. Both ENG ANTI-ICE..... AS REQUIRED

<<END>>

TURBULENCE PENETRATION / SEVERE GUST ENCOUNTER

Turbulence penetration procedure apply to flying at altitude and should not be confused with the low altitude wind shear precautions recommended for takeoff, traffic pattern and approach phase of the flight.

WARNING

DO NOT FLY INTO AREAS OF KNOWN SEVERE TURBULENCE WITH A FAILED YAW DAMPER.

When encountering severe gust turbulence:

1. Avoid rapid thrust changes, if possible
2. CONT IGN ..... ON (verify both IGN symbols)
3. Auto-throttles..... DISENGAGE
4. Turbulence Penetration Speed (V_{RA}):
   - S.L. to 13,000 ft - 230 KIAS
   - 13,000 to 20,000 ft - 250 KIAS
   - 20,000 to 35,000 ft - 270 KIAS
   - 35,000 to 45,000 ft - 0.80 M_i
5. A minimum speed of 1.5 V_S is recommended to maintain adequate buffer margins.

NOTE

Severe turbulence will cause large and often rapid variations in the indicated airspeed.

6. Attitude ..... MAINTAIN DESIRED PITCH ATTITUDE AND WINGS LEVEL
7. Avoid sudden control and thrust changes
8. SEAT BELT / NO SMOKE ..... ON
9. ATC ..... ADVISE

(Continued)

If autopilot is ON:

10. Autopilot ..... USE BASIC ATTITUDE AND HDG MODES
11. Avoid use of flight director VERTICAL modes
12. Pilots inputs should be made using the HDG bug
13. Severe condition may cause autopilot to disengage

If autopilot is OFF or disengaged:

14. Hand fly the aircraft
15. Pitch and roll attitudes may best be controlled with the control yoke only

<<END>>

VOLCANIC ASH ENCOUNTER

Volcanic ash can be recognized by the following conditions:

- Static discharge around the windshield, or bright glow in the engine inlets
- Smoke or dust in the cockpit
- An acrid odor

NOTE

1. Encountering volcanic ash can cause abnormal system reactions:

   - Engine malfunctions (high ITT, stall, flameout)
   - Decrease or loss of airspeed indications
   - Equipment cooling failure

WARNING

VOLCANIC ASH ENCOUNTER MAY LEAD TO SINGLE OR DUAL ENGINE FLAMEOUT. UPON COMPLETION OF THIS PROCEDURE, REVIEW SINGLE ENGINE FAILURE IN FLIGHT, page II-55 AND DUAL ENGINE FAILURE, Page II-69.

1. REVERSE / CHANGE COURSE TO EXIT VOLCANIC CLOUD IN SHORTEST TIME
2. Oxygen masks ..... DON (100%)
3. Crew Communications .....ESTABLISH, SELECT MASK ON ACP
4. Autothrottle..... DISCONNECT
5. Thrust setting ..... LOW (IDLE PREFERRED)
6. ATC ..... ISSUE “PAN” CALL 3 TIMES, ADVISE INTENTIONS

When below 35,000 ft - start APU:

7. APU MASTER.....ON
8. APU START ..... START

(Continued)

If static discharge is observed:

9. L/ R WINDSHIELD HEAT.....OFF

If engines have flamed out, failed or stalled:

10. Thrust levers .....IDLE
11. Land at nearest suitable airport
12. Plan for IFR approach if windshield is obscured
13. Continue with ENGINE RESTART IN FLIGHT, Page II-59

<<END>>

RNAV (GPS/GNSS) APPROACH

1. Published Approach.....REVIEW
2. Approach.....SELECT FROM DATA BASE AND EXECUTE
3. FMS - ARRIVAL DATA.....REVIEW

Arrival Data \ Approach Type	LPV	LP	LNAV/VNAV or LNAV
APPR MODE	LPV	LP	RNP
RNP FAF - MAP	ANG	ANG	0.30
GP MODE	SBAS PROVIDER	BARO	BARO

NOTE

When the only published minimums for an approach are LP, the LP GP MODE will display the SBAS PROVIDER; however, the GP MODE (vertical navigation) is always based on BARO altitude for LP approaches.

4. MDA/DA minima.....SET
5. FMS .....VERIFY IN SYNC MODE
6. NAV Source for LPV Approaches ....BOTH SIDES DO NOT HAVE THE SAME FMS SELECTED

7. When cleared for the approach:

a. For DA/DDA.....Select APPR and VNAV mode on the FCP if VGP desired

b. For MDA..... Select LNAV and VNAV mode if VPATH desired, OR,
Select LNAV and VS or FPA if vertical navigation not desired

(Continued)

NOTE

- When advisory VNAV is provided (i.e. not an LPV), the primary barometric altimeter should be used as the primary reference for compliance with all altitude restrictions that are associated with the instrument approach procedure, including compliance with step-down fixes.
- VGP will not ARM unless APPR is selected.
  - When VGP is the active vertical mode, the airplane will not level off at the FCP selected altitude
- Any vertical mode other than VGP will level off at the selected altitude.
  - The FCP selected altitude must be set below the current altitude to descend in any vertical mode other than VGP

8. When within 2 nm of the FAF (Final Approach Fix), verify appropriate FMS approach mode displayed on the PFD

Approach Type	LPV	LP	LNAV/VNAV or LNAV
HSI Message	LPV APPR	LP APPR	RNP APPR

(Continued)

CAUTION

DO NOT CONTINUE THE APPROACH IF:

- **APPROPRIATE APPROACH MODE IS NOT DISPLAYED, OR**
- **THE AMBER FMS FLAG APPEARS ABOVE THE LATERAL DEVIATION BAR ON THE PFD**

NOTE

- If Amber FMS Flag appears, verify both sides of the cockpit are not using the same NAV source. If the flag appears after passing the FAF, it cannot be cleared and the approach should be discontinued. The flag may clear if still outside the FAF by changing the NAV source so both sides of the cockpit are not using the same source or by selecting the APPR MODE to RNP on the FMS ARRIVAL DATA page.
- If reverting to RNP approach, reset MDA/DA minimums for the appropriate approach being flown.
- If the NAV source is changed on the XFR side, the FD Drop AP Basic Mode caution message will appear. Immediately reselect the desired FCP Vertical and LNAV or APPR modes.

At FAF / GP Intercept:

9. Desired vertical mode ..... VERIFY (VGP or VPATH) or SELECT (VS or FPA)

<<END>>

POLAR NAVIGATION

POLAR REGION DEFINITIONS

Polar latitude thresholds: north of 82° latitude and south of -82° latitude.
North polar keyhole region: between -80° and -170° (west) longitude and north of 73.125° north latitude, at all altitudes.
South polar keyhole region: between 120° and 160° (east) longitude and south of -60° latitude, at all altitudes.

FMS NAVIGATION

The system will automatically switch source to true heading when entering the polar region. When exiting the polar region, manual selection to switch back to source magnetic heading is required. Manual switching between true and magnetic heading can be done manually through the CDU. From page 2 of the CDU index page, select “FMS CTL”. This page will have a control for switching between true and magnetic heading.

STBY INSTRUMENT

In polar region, the SFIS will continue to output a magnetic heading and the ISI will be forced to select source for the SFIS heading; however it is recommended the SFIS heading not be used when north of 70° latitude or south of 70° latitude due to the magnetic fields near the Earth's poles. In addition, operation is also not authorized in the following two regions: north of 65° north latitude between longitude 75°W and 120°W (Northern Canada). South of 55° south latitude between longitude 120° E and 165°E (south of Australia).
If magnetic heading is not failed, the ISI will source true heading only when AHS 3 is the selected heading source on the ISI. If AHS 3 is selected and true heading is the selected mode on the FMS CTL CDU page, the ISI will have a “true” annunciation to the right of the heading readout.
Check SMC - Heading caution message may appear when magnetic deviation high is magnetic SFIS heading and AHS heading difference is exceeding 13°.

Polar region entry:

1. Select true heading (CDU Index page 2 - FMS CTL)
2. Flight director ..... RESELECT DESIRED MODES

NOTE

FMS shows a dashed out position calculation for each AHRS 1 and 2. IRS 3 shows correct position if available.

3. Verify True legend displayed on HSI
4. Verify no HDG flags on HSI
5. Monitor latitude.

When exiting polar region:

6. Select MAG heading (CDU index page 2 - FMS CTL).
7. Verify no HDG flags on HSI
8. Verify that true legend on HSI is removed

AIRPLANE FLIGHT MANUAL

Temporary Revision 1

TEMPORARY REVISION NO. 1

SUBJECT: ENGINE QUALITY ADDER PERFORMANCE CORRECTIONS FOR SECTION V "PERFORMANCE WET AND DRY"

PLEASE INSERT PAGES TR-V-i TRHOUGH TR-V-18 INTO YOUR AIRPLANE FLIGHT MANUAL IN FRONT OF SECTION V UNTIL NEXT REVISION REPLACES THE AFFECTED PAGES.

Affected pages: V-62 through V-77, V-114 through V-117, V-274 through V-277, V-120 through V-236, V-241, V-243 through V-271, V-280 through V-428, V-431, V-434 through V-437, V-440 through V-586, V-589, V-592 through V-595, V-598 through V-746, V-749, V-755, V-758, V-759, V-760, V-762, V-765, V-766 through V-768

ENGINE QUALITY ADDER PERFORMANCE CORRECTIONS

GENERAL

This supplement contains information on takeoff and landing performance correction for the G280 airplane.
The following corrections are to be applied when performing the specified performance calculations using the AFM and the FMS.
Correction charts are provided for the following performance parameters:

- TAKEOFF WEIGHT LIMITATION (AS PREMITTED BY CLIMB REQUIREMENTS)
- TAKEOFF FIELD LENGTH (TOFL)
- TAKEOFF CLIMB GRADIENT - AVAILABLE 2nd SEGMENT CLIMB GRADIENT (GR2) AND FINAL SEGMENT CLIMB GRADIENT
- NET TAKEOFF FLIGHT PATH TRANSITION SEGMENT
  LEVEL FLIGHT ACCELERATION
  HORIZONTAL DISTANCE TRAVELED
- ENROUTE CLIMB GRADIENTS
- APPROACH CLIMB GRADIENTS
- LANDING CLIMB GRADIENTS
- LANDING WEIGHT LIMITATIONS
  (AS PERMITTED BY CLIMB REQUIREMENTS)

These corrections cover all performance calculations available, i.e. for performance using sections V (performance on dry and wet runways), performance using section X-5 (Flaps 0° performance) and section X-8 (contaminated runways performance), and performance given for all abnormal procedures.

USAGE OF TEMPORARY REVISION CORRECTION CHARTS

Calculating the corrected performance values using the following figures is performed in a similar manner for all correction charts.
Enter the correction chart with the calculated AFM/FMS performance value (figure X axis) and find corrected value (figure Y axis) at the intersection with the compatible correction line (see example on Figure TR1-V-1).

EXAMPLES

1. Determine the Takeoff field length required at the following runway conditions:
   - Gross Weight: 38,000 lb
   - Dry Runway
   - Flaps Setting: 20°
   - Pressure altitude: 1,000 ft
   - Ambient temperature: -5°C
   - Engine bleed setting: ECS-ON, Engine and Wing Anti-ice OFF
   - No Wind
   - Runway Slope: +2%

Result:
From Figure 5-69 we find an uncorrected TOFL of 4,320 ft.
Using Figure 5-99 no wind component correction is required, thus the corrected TOFL for the runway slope is 5,950 ft.
Correct the TOFL using Figure TR1-V-3 and receive 6,350 ft.

2. For the same conditions as example 1, Determine the Available 2nd segment climb gradient:

Result:
From Figure 5-69 we find an uncorrected GR2 of 6.2%.
No wind component correction is required.
Correct GR2 using Figure TR1-V-4 and receive 5.95%.

TOC Main

N1 SETTINGS

For Static thrust, No N1 Settings correction is required.
Lower expected N1 Setting value by 0.47% when the aircrafts speed is above 80 KCAS.
These corrections are applicable for:

Figure	Description	Page
5-4 through 5-7	STATIC TAKEOFF THRUST ECS-OFF EAI-OFF WAI-OFF; ECS-ON EAI-OFF WAI-OFF; ECS-ON EAI-ON WAI-OFF; ECS-ON EAI-ON WAI-ON	V-62 through V-65
5-8 through 5-11	MAX CLIMB THRUST (180 KCAS) ECS-OFF EAI-OFF WAI-OFF; ECS-ON EAI-OFF WAI-OFF; ECS-ON EAI-ON WAI-OFF; ECS-ON EAI-ON WAI-ON	V-66 through V-69
5-12 through 5-15	ENROUTE CLIMB THRUST (180 KCAS) ECS-OFF EAI-OFF WAI-OFF; ECS-ON EAI-OFF WAI-OFF; ECS-ON EAI-ON WAI-OFF; ECS-ON EAI-ON WAI-ON	V-70 through V-73
5-16 through 5-19		V-74 through V-77

TAKEOFF WEIGHT LIMITATION (AS PREMITTED BY CLIMB REQUIREMENTS)

Use Figure TR1-V-2 to correct the takeoff weight limitation as permitted by climb requirements.
This correction chart is applicable for:

Figure	Description	Page
5-48 through 5-51 5-101 through 5-104	Takeoff Weight limitation (limited by climb gradients) RUNWAY DRY AND WET; FLAPS 20°; ECS-OFF EAI-OFF WAI-OFF; ECS-ON EAI-OFF WAI-OFF; ECS-ON EAI-ON WAI-OFF; ECS-ON EAI-ON WAI-ON	V-114 through V-117 V-274 through V-277
5-154 through 5-157 5-207 through 5-210	Takeoff Weight limitation (limited by climb gradients) RUNWAY DRY AND WET; FLAPS 10°; ECS-OFF EAI-OFF WAI-OFF; ECS-ON EAI-OFF WAI-OFF; ECS-ON EAI-ON WAI-OFF; ECS-ON EAI-ON WAI-ON	V-434 through V-437 V-592 through V-595

NOTE

Calculate the maximum allowable takeoff weight (weight at brake release) as described Section V — TAKEOFF PERFORMANCE (Page V-18).

TAKEOFF FIELD LENGTH

Use Figure TR1-V-3 to correct the takeoff field length.
Figure TR1-V-3 presents correction lines applicable for takeoff on dry, wet and runways contaminated with compacted snow, ice or dry snow. The correction charts contains correction lines for different runway slopes. These corrections are to be used in addition to the TOFL Runway slope correction charts presented in the AFM. First calculate the TOFL from the AFM/FMS including Wind component, Runway slope and Thrust reverser effect, and then apply the appropriate correction according to the existing runway slope.

Figure TR1-V-3 is applicable for:

Figure	Description	Page
5-54 through 5-83 5-86 through 5-100 and 5-85	TOFL FLAPS 20°; DRY RUNWAY ALL ENGINE BLEED SETTINGS	V-120 through V-236 V-243 through V-271 and V-241
5-107 through 5-151 and 5-153	TOFL FLAPS 20°; WET RUNWAY ALL ENGINE BLEED SETTINGS	V-280 through V-428 and V-431
5-160 through 5-204 and 5-206	TOFL FLAPS 10°; DRY RUNWAY ALL ENGINE BLEED SETTINGS	V-440 through V-586 and V-589
5-213 through 5-257 and 5-259	TOFL FLAPS 10°; DRY RUNWAY ALL ENGINE BLEED SETTINGS	V-598 through V-746 and V-749

* For flaps 0°, TOFL and V1 with engine bleed settings ECS-ON EAI-OFF WAI-OFF, ECS-ON EAI-ON WAI-ON or OFF, see instructions in Supplement 5: TAKEOFF CHARTS AND TABLES (X-5-12);
First apply the climb gradients reductions due to bleed, and after that apply the correction of Figure TR1-V-3.

TAKEOFF CLIMB GRADIENTS

Use Figure TR1-V-4 to correct both the takeoff available 2nd segment climb gradient and the takeoff final segment climb gradient (same correction line applies for both parameters).
The correction chart is applicable to:

Figure	Description	Page
5-54 through 5-83 5-86 through 5-100 and 5-85, 5-263	GR2; FLAPS 20°; DRY RUNWAY ALL ENGINE BLEED SETTINGS	V-120 through V-236 V-243 through V-271 and V-241, V-755
5-107 through 5-151 and 5-263	GR2; FLAPS 20°; WET RUNWAY ALL ENGINE BLEED SETTINGS	V-280 through V-428 and V-755
5-160 through 5-204 and 5-263	GR2; FLAPS 10°; DRY RUNWAY ALL ENGINE BLEED SETTINGS	V-440 through V-586 and V-755
5-213 through 5-257 and 5-263	GR2; FLAPS 10°; WET RUNWAY ALL ENGINE BLEED SETTINGS	V-598 through V-746 and V-755
5-269	FINAL SEGMENT GRADIENT	V-760

* For flaps 0°, second segment gradient with engine bleed settings ECS-ON EAI-OFF WAI-OFF, ECS-ON EAI-ON WAI-ON or OFF, see instructions in Supplement 5: TAKEOFF CHARTS AND TABLES (X-5-12, X-5-13);
First apply the climb gradients reductions due to bleed, and after that apply the correction of Figure TR1-V-4.

NET TAKEOFF FLIGHT PATH TRANSITION SEGMENT

Use Figure TR1-V-5 to correct the Net Takeoff Flight Path Transition Segment Horizontal Distance Traveled.
The correction chart is applicable for:

Figure	Description	Page
5-267	Horizontal distance-transition segment FLAPS 20°	V-758
5-268	Horizontal distance-transition segment FLAPS 10°	V-759

ENROUTE CLIMB GRADIENTS

Use Figure TR1-V-6 to correct the Enroute Climb gradient.
Correction applies for all engine bleed settings.
The correction chart is applicable for:

Figure	Description	Page
5-271	Enroute Climb Gradient CLEAN CONFIGURATION	V-762

APPROACH CLIMB GRADIENTS

Use Figure TR1-V-7 to correct the approach climb gradient. Correction applies for approach climb in all engine bleed settings. The Correction chart is applicable for:

Figure	Description	Page
5-272	Approach Climb Gradient FLAPS 20°; GEAR UP	V-765

LANDING CLIMB GRADIENTS

Use Figure TR1-V-8 to correct the Landing climb gradient. Correction applies for Landing Climb in all engine bleed settings. The Correction chart is applicable for:

Figure	Description	Page
5-272	Landing Climb Gradient FLAPS 39°; GEAR DOWN	V-765

LANDING WEIGHT LIMITATIONS (AS PERMITTED BY CLIMB REQUIREMENTS)

Use Figure TR1-V-9 to correct the Landing weight limitation as permitted by climb requirements.
This correction chart is applicable for:

Figure	Description	Page
5-273 through 5-275	Landing Weight Limitation RUNWAY DRY AND WET; ECS-ON EAI-OFF WAI-OFF; ECS-ON EAI-ON WAI-OFF; ECS-ON EAI-ON WAI-ON	V-766 through V-768

NOTE

Calculate the maximum allowable Landing weight as described in Section V FINAL APPROACH AND LANDING PERFORMANCE (Page V-50)

5-6 Static Takeoff Thrust - N_1 Setting; APR - Off; Engine Anti-ice - On; Wing Anti-ice - Off; ECS - On V-64
5-7 Static Takeoff Thrust - N_1 Setting; APR - Off; Engine Anti-ice - On; Wing Anti-ice - On; ECS - On V-65
5-8 Maximum Climb Thrust - N_1 Setting; Final Segment; Engine Anti-ice - Off; Wing Anti-ice - Off; ECS - Off V-66
5-9 Maximum Climb Thrust - N_1 Setting; Final Segment; Engine Anti-ice - Off; Wing Anti-ice - Off; ECS - On V-67
5-10 Maximum Climb Thrust - N_1 Setting; Final Segment; Engine Anti-ice - On; Wing Anti-ice - Off; ECS - On V-68
5-11 Maximum Climb Thrust - N_1 Setting; Final Segment; Engine Anti-ice - On; Wing Anti-ice - On; ECS - On V-69
5-12 Enroute Climb Thrust - N_1 Setting; Engine Anti-ice - Off; Wing Anti-ice - Off; ECS - Off V-70

LIST OF FIGURES (Continued)

Figure — Page

5-13 Enroute Climb Thrust - N_1 Setting; Engine Anti-ice - Off; Wing Anti-ice - Off; ECS - On V-71
5-14 Enroute Climb Thrust - N_1 Setting; Engine Anti-ice - On; Wing Anti-ice - Off; ECS - On V-72
5-15 Enroute Climb Thrust - N_1 Setting; Engine Anti-ice - On; Wing Anti-ice - On; ECS - On V-73
5-16 Balked Landing / Approach Climb - N_1 Setting; Engine Anti-ice - Off; Wing Anti-ice - Off; ECS - Off V-74
5-17 Balked Landing / Approach Climb - N_1 Setting; Engine Anti-ice - Off; Wing Anti-ice - Off; ECS - On V-75
5-18 Balked Landing / Approach Climb - N_1 Setting; Engine Anti-ice - On; Wing Anti-ice - Off; ECS - On V-76
5-19 Balked Landing / Approach Climb - N_1 Setting; Engine Anti-ice - On; Wing Anti-ice - On; ECS - On V-77
5-20 Airspeed Residual Error Correction Clean Configuration V-78
5-21 Altimeter Residual Error Correction; Clean Configuration V-79
5-22 Machmeter Residual Error Correction; Clean Configuration V-80
5-23 Airspeed Residual Error Correction; Both AOA Failed; Clean Configuration V-81
5-24 Airspeed Residual Error Correction; Both AOA Failed; Flaps - 10° V-82

LIST OF FIGURES (Continued)

Figure — Page

5-25 Airspeed Residual Error Correction; Both AOA Failed; Flaps - 20° V-83
5-26 Airspeed Residual Error Correction; Both AOA Failed; Flaps - 39° V-84
5-27 Machmeter Residual Error Correction; Both AOA Failed; Clean Configuration V-85
5-28 Altimeter Residual Error Correction; Both AOA Failed; Clean Configuration V-86
5-29 Altimeter Residual Error Correction; Both AOA Failed; Flaps - 10° V-87
5-30 Altimeter Residual Error Correction; Both AOA Failed; Flaps - 20° V-88
5-31 Altimeter Residual Error Correction; Both AOA Failed; Flaps - 39° V-89
5-32 Approved Altitude/Temperature Envelope V-90
5-33 Minimum Control Speed - Ground (V_{MCG}) Flaps 10° and Flaps 20° V-91
5-34 Minimum V_1 Speed Allowed by V_{MCG} Flaps 10° and Flaps 20° V-92
5-35 Minimum Control Speed - Air (V_{MCA}), Flaps 10° and Flaps 20° V-93
5-36 Reference Stall Speeds Idle Thrust; Speed Brakes Retracted; Flaps - 0° V-94
5-37 Reference Stall Speeds Idle Thrust; Speed Brakes Retracted; Flaps - 10° V-95

LIST OF FIGURES (Continued)

Figure Page

5-38 Reference Stall Speeds Idle Thrust; Speed Brakes Retracted; Flaps - 20° V-96
5-39 Reference Stall Speeds Idle Thrust; Speed Brakes Retracted; Flaps - 39° V-97
5-40 Reference Stall Speeds Idle Thrust; Speed Brakes Fully Extended; Flaps - 0° V-98
5-41 Reference Stall Speeds Idle Thrust; Speed Brakes Fully Extended; Flaps - 10° V-99
5-42 Reference Stall Speeds Idle Thrust; Speed Brakes Fully Extended; Flaps - 20° V-100
5-43 Reference Stall Speeds Idle Thrust; Speed Brakes Fully Extended; Flaps - 39° V-101
5-44 Determination of Overall Longitudinal Center of Gravity Location V-102
5-45 Horizontal Stabilizer Trim Setting for Takeoff; Flaps - 20° V-103
5-46 Horizontal Stabilizer Trim Setting for Takeoff; Flaps - 10° V-107
5-47 Buffet Boundary; Clean Configuration V-111

TAKEOFF CHARTS AND TABLES; FLAPS - 20°; DRY RUNWAY

5-48 Takeoff Weight Limitations (As Permitted by Climb Requirements) Flaps - 20°; ECS - Off; Engine Anti-ice - Off; Wing Anti-ice - Off V-114
5-49 Takeoff Weight Limitations (As Permitted by Climb Requirements) Flaps - 20°; ECS - On; Engine Anti-ice - Off; Wing Anti-ice - Off V-115
5-50 Takeoff Weight Limitations (As Permitted by Climb Requirements) Flaps - 20°; ECS - On; Engine Anti-ice - On; Wing Anti-ice - Off V-116

GENERAL INFORMATION

COMPLIANCE

Information in this section complies with appropriate performance criteria and certification requirements.

STANDARD PERFORMANCE CONDITIONS

All performance data in this section are based upon flight test data and the following conditions:

1. Approved engine thrust ratings are based on a minimum engine including allowances for installation, air-bleed, and accessory items.
2. Takeoff thrust is available for a maximum time of 10 minutes for emergency, engine-out operations and is used through the takeoff, second segment climb, and acceleration to V_{SE} at level-off height AGL. The takeoff thrust setting is also used for the evaluation of approach climb capability
3. Full temperature accountability within the operational limits for which the aircraft is certified.
4. Go-Around Thrust is used for computing the all-engines operating landing climb capability.
5. Maximum continuous thrust is used for computing enroute climb capability.
6. Full temperature accountability within the operational limits, except for landing distance which is based on standard day.

NOTE

If ambient temperature is below lowest temperature shown on performance charts, use performance of lowest temperature shown.

7. Humidity effect on engine thrust has been considered in performance data.

(Continued)

8. Flaps position:
   a. Takeoff - 20° or 10°
   b. Approach - 20°
   c. Landing - 39°
   d. Enroute - 0°
9. Altitude and field elevations are pressure altitudes unless stated otherwise.
10. Takeoff and landing performance based upon smooth, dry or wet, hard-surfaced runway surface.
11. Takeoff distances are defined up to the height of 35 ft AGL on a dry runway or 15 ft AGL on a wet runway.
12. Wet runway takeoff performance accounts for the use of thrust reversers down to 40 kt, followed by idle reverse down to a complete stop.
13. Takeoff performance data is presented for takeoff weights of and above 26,000 lb. For takeoff weight less than 26,000 lb, use takeoff performance for 26,000 lb.
14. For negative pressure altitudes, correct V_1 and V_R as defined in note 2 on page V-25. For V_2, Balanced Field Length (TOFL) and Second Segment Gradient (GR2) use sea level data.
15. The Primary Flight Display (PFD) shows values of calibrated airspeed, Mach number, and pressure altitude, which have been corrected for in-flight position errors within the Air Data Computer (ADC).

VARIABLE FACTORS AFFECTING PERFORMANCE

Performance data is presented for the following engine bleed configurations:

1. Bleed off
2. ECS bleed on, engine anti-ice and wing anti-ice off
3. ECS bleed on, engine anti-ice on and wing anti-ice off
4. ECS bleed on, engine anti-ice and wing anti-ice on

For configuration: ECS bleed and wing anti-ice off, engine anti-ice on, use performance data from configuration 4.

Winds, for which graphical correction is presented, are to be understood as the headwind or tailwind components of the actual winds at 10 meters above the runway surface (tower winds). Wind corrections are calculated as required by CFR 14, Part 25 (includes conservatism factors: 50% headwind or 150% tailwind).

DEFINITIONS

GENERAL

Instrument Error - Difference between actual and indicated values.

Position Error - Error resulting from location of static source

ISA - International Standard Atmosphere.

Takeoff Weight - Weight at brake release at start of takeoff roll.

Maximum Brake Energy - The brake energy with maximum effort braking at weights associated with the takeoff brake energies shown on the takeoff weight limits charts. Distances expressed on the takeoff field length charts are achieved if the takeoff is aborted at V_1. However, after the stop, wheel fuse plugs may release and brake and tire damage will occur.

Maximum Landing Brake Energy - The brake energy with maximum effort braking at weights associated with the landing brake energies shown on the landing weight limits charts. Landings in which brake energy is kept below this value can be accomplished without wheel fuse plug release or tire damage. Maximum effort stops in which brake energy exceeds this value may cause excessive brake wear, and after the stop, may cause wheel fuse plug release and damage tires.

(Continued)

APR - The APR (automatic power reserve) rating is the maximum thrust certified for takeoff operation within established engine limits for specific ambient conditions. It is obtained automatically (without pilot action) when the APR system has been armed for takeoff and the system senses the failure of one engine. APR may also be selected by pressing the APR ON pushbutton on the center instrument panel.
Activation of APR thrust imposes a penalty on life limited components within the engine. APR thrust is limited to emergency operation (one engine inoperative, windshear, etc.) for a time limit of ten minutes.

AOA - Angle of attack.

ADC - Air data computer.

RSE - Remote standby equipment (backup air data source).

ATMOSPHERIC

Ambient Temperature- Static air temperature (SAT) obtained either from ground meteorological sources or from in-flight SAT readings

Field Elevation - Pressure altitude at airport.

Pressure Altitude - Altimeter reading when set to a barometric pressure of 1013.2 mb (29.92 in. Hg) and corrected for static source position error and instrument error.

Wind - Wind velocities, recorded as variables on charts of this section, are headwind (+) or tailwind (-) components of actual winds at 10 meters above runway surface (tower winds).

AIRSPEEDS

All airspeed numbers in this manual, unless stated otherwise, are indicated values and assume zero instrument error.

IAS - Indicated Airspeed
Airspeed indicator reading, as installed in aircraft.

CAS - Calibrated Airspeed
Airspeed indicator reading, corrected for static source position error and instrument error.

EAS - Equivalent Airspeed
Airspeed indicator reading, corrected for instrument error, position error and compressibility effects.

TAS - True Airspeed
Airspeed of an aircraft relative to undisturbed air.

M_i - Indicated Mach Number
Machmeter reading corrected for instrument error

M - True Mach Number (ratio of true airspeed to speed of sound).

(Continued)

V_{MCG} - Minimum Control Speed - Ground (altitude dependent)
Minimum speed on the ground at which control can be maintained using aerodynamic controls alone and wings level, when one engine suddenly becomes inoperative and the remaining engine is operating at APR thrust.

V_{MCA} - Minimum Control Speed - Air (altitude dependent)
The minimum flight speed during takeoff at which the airplane is controllable with up to 5° of bank when one engine suddenly becomes inoperative and the remaining engine is operating at APR thrust.

V_{MCL} - Minimum Control Speed - Landing (altitude dependent).
The minimum flight speed during landing at which the airplane is controllable with up to 5° of bank when one engine suddenly becomes inoperative and the remaining engine is operating at APR thrust.

V_{EF} - speed at which critical engine is assumed to fail during takeoff.

V_1 - Decision speed
Speed at which, due to engine failure at V_{EF} or other causes, pilot can elect to stop or to continue takeoff. Distance to continue takeoff to height of 35 ft (15 ft on wet runway) or to bring aircraft to full stop, will not exceed scheduled takeoff distance
In the event of an engine failure, this speed takes into account of the pilot recognition and reaction time of 1.0 second, including the pilot's first action after recognizing the engine failure. For an all-engine rejected takeoff, this is the speed at which the pilot performs his first action to abort.
V_1 must not be less than V_1 (V_{MCG}), or greater than V_R.

(Continued)

$V_1(V_{MCG})$ - Minimum V_1 speed allowed by V_{MCG}.

V_R - Rotation speed.
Speed at which rotation to lift-off attitude is initiated during takeoff.

V_{LOF} - Lift-off Speed
Speed at which aircraft first becomes airborne.

V_2 - Takeoff Safety Speed.
The target speed to be attained at the 35 foot height following an engine failure. If an engine failure should occur after passing V_2 on takeoff, it is recommended that the speed at the time of engine failure (up to V_2 + 10 kt) be maintained to ensure that the climb gradient is at or near the maximum climb gradient available.

V_{SE} - Enroute climb speed
the recommended airspeed for single-engine climb in the enroute (clean) configuration.

V_A - Maneuvering speed
Maximum speed at which application of full available aileron, rudder, or elevator will not overstress aircraft.

V_{SR} - Reference stall speed.
In accordance with 1G stall speed criteria, the reference stall speed for aircraft equipped with a stall identification system must not be less than the greater of 2 knots or 2 percent above the speed at which the device activates.

V_{SR1} - Reference stall speed in takeoff, enroute and approach configuration.

V_{SRO} - Reference stall speed in landing configuration (landing gear down, flaps 39°).

V_{APP} - Approach recommended speed based on V_{REF} + 5 KCAS.

V_{REF} - Landing reference speed
Target speed at 50 ft above runway surface during normal landing. This speed is equal to 1.29 V_{SR} (landing configuration).

DISTANCES

Takeoff data presented in this section is based upon smooth, dry or wet, hard-surfaced runway.

Accelerate-Stop Distance - The accelerate-stop distance is the greater of the two following distances:

1. The horizontal distance required to accelerate with both engines operating to V_1 and come to full stop when aborting takeoff at V_1.
2. The horizontal distance required to accelerate and come to a full stop when the pilots rejects takeoff at V_1 following one engine failure at V_{EF}.

Engine-Out Accelerate-Go Distance - The horizontal distance from brake release to the point at which the airplane attains a height of 35 ft (15 ft for wet and contaminated runways) above the runway surface, on a takeoff during which one engine fails at V_{EF}, recognition occurs at V_1 and the pilot elects to continue.

(Continued)

Takeoff Field Length (TOFL)

- The takeoff field length given for each combination of airplane weight, atmospheric temperature, altitude, wind, and runway slope is the greatest of the following:

1. 115% of the all-engine takeoff distance from start to a height of 35 feet above the runway surface.
2. The engine-out accelerate-go distance.
3. The accelerate-stop distance with one engine failed at V_{EF}.
4. The accelerate-stop distance with all engines operating.

No specific identification is made on the charts as to which of the above distances governs a specific case. V_1 is normally selected to balance the accelerate-stop distance with the engine-out accelerate-go distance, when possible

Balanced Field Length (TOFL)- Distance obtained by choosing engine failure speed (V_{EF}), so that takeoff distance and accelerate-stop distance are identical. This distance must not exceed available runway length.

Unbalanced Field Length - When V_{EF} is assumed so that takeoff distance and accelerate-stop distance are not equal.

Dry Runway - In addition to runways which are not “Wet” or “Contaminated”, according to the definitions below, this include runways which have been specially prepared with grooves or porous pavement and maintained to retain “effectively dry” braking action, even when moisture is present.

Wet Runway - Runway is wet with no significant standing water (less than 3 mm).

(Continued)

Contaminated Runway - A runway surface is considered contaminated when more than 25% of the runway surface area is covered with standing water, slush, loose snow (dry wet), compacted snow or ice.

Actual Landing Distance - The actual landing distances presented in this section are based on a smooth, paved runway. The actual landing distance is equal to the horizontal distance from a point 50 feet above the touchdown point on the runway surface to the point at which the airplane would come to a full stop on the runway.

Factored Landing Distance - The factored dry landing distances presented in this section are equal to the actual landing distance divided by 0.60 (multiplied by 1.67). The wet landing distance is the factored dry landing distance multiplied by 1.15.

GRADIENT OF CLIMB

1. Gradient of Climb
   The ratio of the change in height during a portion of the climb to the horizontal distance traversed in the same time interval.
2. Gross Gradient of Climb
   The climb gradient that the airplane can actually achieve given ideal conditions
3. GR2
   Second segment gross climb gradient.
4. Net Gradient of Climb
   The gross climb gradient reduced by 0.8% during the takeoff phase and 1.1% enroute.

HEIGHT

1. Gross Height
   Geometric height attained using gross climb gradient in a specified time period. Gross height is used to calculate actual pressure altitude, at level-off heights.

2. Net Height
   Geometric height attained using net climb gradients in a specified time period.
   Net height is used to determine a net flight path which will clear any obstacles by at least 35 ft to comply with regulations.

ICING

Icing conditions exist when OAT is 10°C or below, and visible moisture in any form is present (such as: clouds, fog with visibility of one mile or less, rain, snow, sleet and ice crystals).

PERFORMANCE CONFIGURATIONS

Configurations in charts correspond to following settings (APR - ON for single engine operation):

Configuration	Number of Engines Operating	Thrust	Flaps Position	Gear
1st and 2nd Segment T/O Climb	1	T/O	20° or 10°	DOWN then UP
3rd Segment - Acceleration	1	T/O	20° to 0°	UP
Final Segment Climb	1	Max Climb	0°	UP
Enroute Climb	1	Max Climb	0°	UP
Approach Climb	1	T/O	20°	UP
Landing Climb	2	T/O	39°	DOWN

DEMONSTRATED CROSSWIND

The maximum demonstrated crosswind component for takeoff and landing is 25 knots.

NOISE LEVELS

The following noise levels comply with part 36, appendix B, Stage 5 maximum noise level requirements and were obtained by analysis of approved data from noise tests conducted under the provisions of part 36, Amendment 31. The noise measurement and evaluation procedures used to obtain these noise levels are considered by the FAA to be equivalent to the Chapter 14 noise levels required by the International Civil Aviation Organization (ICAO) in Annex 16, Volume 1, Aircraft Noise, Seventh Edition, July 2014, Amendment 11-B, applicable January 1, 2015.

Lateral	89.5
Flyover	75.2
Approach	90.5

No determination has been made by the CAAI that the noise levels of this aircraft are or should be acceptable or unacceptable for operation at, into, or out of, any airport.

No determination has been made by the Civil Aviation Authority of Israel that the noise levels of this aircraft are or should be acceptable or unacceptable for operation at, into, or out of, any airport.

No determination has been made by the European Aviation Safety Agency that the noise levels of this aircraft are or should be acceptable or unacceptable for operation at, into, or out of, any airport.

Lateral and flyover noise levels were obtained at the maximum takeoff weight (MTOM) of 39,600 lb, takeoff flaps - 10° and anti-ice system off. Thrust reduction in accordance with FAR Part 36 and ICAO Annex 16 was used to determine flyover noise level.

Approach noise levels were established on a 3° glide-slope, with landing gear down, flaps - 39°, APU - on, at the maximum landing weight of 32,700 lb.

PITOT-STATIC POSITION ERROR CALIBRATION

The pilot, copilot and RSE airspeed, Mach and altitude data is corrected by the ADCs, using static source error correction tables.

For altitudes below 27,350 ft, the ADC static source error correction tables are based on AOA data, and no residual correction is required.

For altitudes at and above 27,350 ft, residual error corrections for pilot, copilot and RSE pitot-static system must be added to the indicated displayed information in order to obtain correct values (i.e. CAS = IAS + Airspeed Residual Error).
These residual error corrections are included in figures 5-20 through 5-22.

NOTE

When crossing 27,350 ft, crew may encounter a momentary shift (up or down) in indication of airspeed, mach and altitude due to change in methods of automatic correction.

PITOT-STATIC POSITION ERROR CALIBRATION WITH FAILED AOA READING

If both AOA readings have failed, the ADC and RSE corrections at and below 27,350 ft automatically revert to a default correction table. Residual errors are included in figures 5-23 through 5-31.

ENGINE PERFORMANCE

Aircraft take off, climb and landing performances are based on obtaining proper engine thrust as shown in charts. Performance is based on obtaining proper engine thrust as shown in charts, Static Takeoff Thrust - N_1 Setting, and Maximum Continuous Thrust - N_1 Setting (Figures 5-4 through 5-19). N_1 settings less than those shown are cause for investigation. If pressurization is on during takeoff, correction noted on applicable chart must be applied.

Enter charts with ambient temperature; move up to pressure altitude, then across, to read N_1.

Example:

Assume the following takeoff conditions:

1. Runway elevation - 2000 ft
2. OAT - 0°C
3. Engine anti-ice - off
4. Wing anti-ice - off
5. ECS - off

Required: Static takeoff thrust

From Figure 5-4:

N_1 = 87.6%

NOTE

The same information can be extracted from takeoff performance tables for the appropriate field elevation (for the given example, use Figure 5-56).

APPROVED FLIGHT ENVELOPE

The approved altitude / temperature flight envelope is presented in Figure 5-32

REFERENCE STALL SPEEDS - IDLE THRUST

Variations of reference stall speeds, V_{SR}, with weight and altitude for speed brakes retracted are shown for all flap positions setting in Figure 5-36 through Figure 5-39.

The reference stall speed increases resulting from speed brakes extended are not uniform and cannot be shown as singular values for each flap setting. Hence, separate charts are presented for speed brakes fully extended in Figure 5-40 through Figure 5-43.

The reference stall speeds presented in this section were developed in accordance with 1G stall speed criteria for airplanes equipped with a stall identification system, which states “the reference stall speed used to determine the minimum operating speeds must not be less than the greater of 2 knots or 2 percent above the speed at which the device activates”.

Example: determine the reference stall speed

Given:
Flaps - 20°
Speed brakes - Retracted
Pressure altitude - 5000 ft
Gross weight - 38.000 lb

Stall speed = 119 KCAS

TAKEOFF PERFORMANCE

MAXIMUM ALLOWABLE TAKEOFF WEIGHT

The maximum allowable takeoff weight (weight at brake release) is lowest value determined by each of following requirements:

1. Field length weight limitation.
2. Climb weight limitation.
3. Tire speed weight limitation.
4. Maximum brake energy weight limitation.
5. Takeoff flight path weight limitation (obstacle clearance).
6. Maximum structural takeoff weight.

Figure 5-1 provides a schematic definition of the takeoff weight determination procedure.

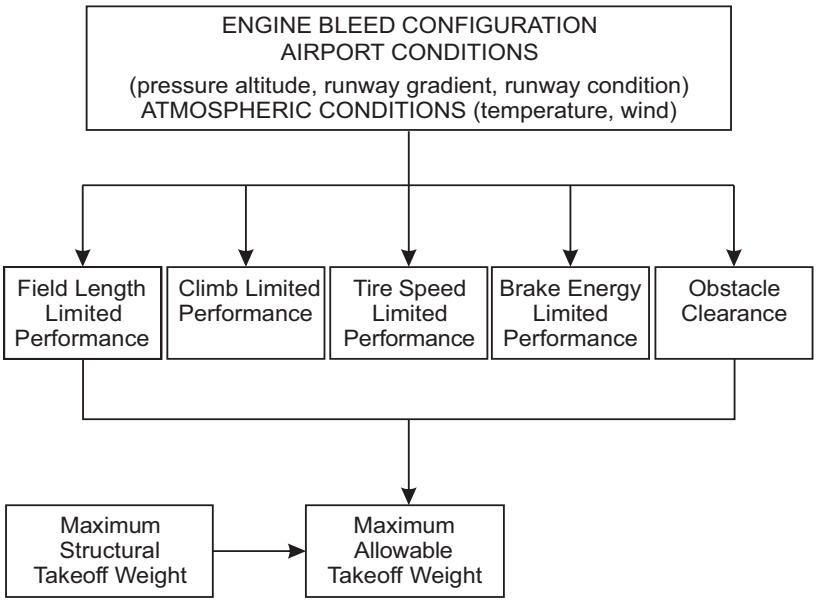

Figure 5-1. Determination Of Maximum Allowable Takeoff Weight

(Continued)

Takeoff performance charts are presented for flaps 10° and 20°. Takeoff with flaps 20° results in a shorter takeoff distance for a given weight, or higher takeoff weight for a given field length. It is also less restricted by brake energy or tire limits. Takeoff with flaps 10° results in higher climb gradients, and will permit higher takeoff weights when climb limited or obstacle clearance limited. If the takeoff weight determination procedure with flaps 20° shows that the weight is restricted by climb performance or obstacle clearance requirements, the procedure should be repeated for takeoff flaps 10°. This could allow a higher takeoff weight.

Once the scheduled takeoff weight is determined, the corresponding takeoff speeds (V_1, V_R and V_2) can be calculated considering applicable speed limitations.

The following paragraphs provide more information on each takeoff weight limitation.

MAXIMUM TAKEOFF WEIGHT AS PERMITTED BY CLIMB GRADIENT REQUIREMENTS

Figure 5-48 through Figure 5-51 flaps - 20° and Figure 5-154 through Figure 5-157 flaps - 10° present the information necessary to determine the maximum allowable takeoff weight as limited by gross climb performance limits. The maximum takeoff weight is determined for airport pressure altitude and reported ambient temperature.
Separate charts are presented for various engine bleed configurations.

The charts do not specify the limiting climb segment, only that any one or a combination of the climb segments (first, second) that are limiting. Final segment is never a limiting factor.

The charts are repeated for convenience on Figure 5-101 through Figure 5-104 (for flaps - 20°) and Figure 5-207 through Figure 5-210 (for flaps - 10°) for wet runway conditions.

MAXIMUM TAKEOFF WEIGHT AS PERMITTED BY BRAKE ENERGY LIMITATIONS

Figure 5-52 (for flaps - 20°) and Figure 5-158 (for flaps - 10°) present the information necessary to determine the maximum allowable takeoff weight as limited by the maximum braking energy at a rejected takeoff. Corrections for the reported wind and field slope are presented.
The charts are repeated for convenience on Figure 5-105 (for flaps - 20°) and Figure 5-211 (for flaps - 10°) for wet runway conditions.

MAXIMUM TAKEOFF WEIGHT AS PERMITTED BY TIRE SPEED LIMITATIONS

Figure 5-53 (for flaps - 20°) and Figure 5-159 (for flaps - 10°) present the information necessary to determine the maximum allowable takeoff weight as permitted by the tire speed limitation. Correction for the reported wind is included.

Between the two conditions (V_{LOF} may not exceed the main wheel tire limit speed of 195 knots, and V_R may not exceed the nose wheel tire limit speed of 182 knots) the nose wheel limitation is a restricting factor.
The charts are repeated for convenience on Figure 5-106 (for flaps - 20°) and Figure 5-212 (for flaps - 10°) for wet runway conditions.

TAKEOFF FIELD LENGTH

The takeoff field length and takeoff airspeeds tables and charts in this manual are presented for flap settings 20° and 10° flap setting and show the takeoff distance and speeds as a function of altitude, temperature, and weight.
Corrections to the takeoff distances for reported wind and runway slope are also provided.

Different tables are provided for the various engine bleed configurations.

Distances and speeds are presented separately for dry and wet runways.

Care must be taken that the correct tables are used. The runway condition is noted in the table headings.
The presented wet runway takeoff data is based on the use of thrust reversers for rejected takeoff. The basic data assume that both thrust reversers are available at dispatch. For dispatch with one or both thrust reversers inoperative, use the included corrections for V1 and TOFL

TAKEOFF SPEEDS (V_1, V_R, V_2)

The following takeoff speeds are presented in the tables:
V_1 = Takeoff decision speed
V_R = Takeoff rotation speed
V_2 = Takeoff safety speed

V_1 must be further corrected for runway slope and wind.

The decision speed, V_1, is basically selected so that takeoff distance is equal to accelerate stop distance; this is the balanced field length condition and allows the highest takeoff weight for given conditions.

However, V_1 may not be selected so that the speed at which the engine is assumed to fail (V_{EF}) is less than V_{MCG} or higher than rotation speed V_R. When these limitations on V_1 arise, an unbalanced field length situation exists. When V_1 is limited by V_{MCG} the accelerate-stop distance is longer than the takeoff distance (this situation may occur at light gross weight, low altitude conditions). When V_1 is limited by V_R, takeoff distance following failure of one engine is the longer one.(this situation may occur at high gross weight, high altitude and/or high temperature conditions).

For determination of the minimum V_1 allowed by V_{MCG} ($V_1(V_{MCG})$) as a function of takeoff field elevation and temperature refer to figure Figure 5-34. Figure 5-33 presents the ground minimum control speed (same for both takeoff flaps settings) - V_{MCG} as a function of takeoff field elevation and temperature.

V_1 corrections for reported wind and runway slope are presented separately for 20° and 10° flaps settings in Figure 5-84 (for flaps - 20°) and Figure 5-205 (for flaps - 10°) for dry runways and in Figure 5-152 (for flaps - 20°) and Figure 5-258 (for flaps - 10°) for wet runways.
(correction for the number of thrust reversers available at dispatch is also included).
If the corrected V_1 is less than $V_1(V_{MCG})$, use $V_1=V_1(V_{MCG})$.
If the corrected V_1 greater than V_R, use $V1=V_R$.

MINIMUM CONTROL SPEED - AIR (V_{MCA})

For variation of minimum control speed in the air ($V_{MCA)}$ as a function of takeoff field elevation and temperature refer to Figure 5-35.(same for both takeoff flaps settings).

TAKEOFF CHARTS AND TABLES

Takeoff data is provided for field elevations from sea level to 14,000 ft. Each field elevation data has two tables as follows:
Part A - For OAT between -54°C and -5°C
Part B - For OAT between 0°C and 50°C

Pilot may interpolate performance between adjacent elevation and temperature values.

Tables to determine V_1, V_R, V_2, second segment climb gradient (GR2) and takeoff field length (TOFL) for zero wind, zero runway gradient conditions:

For flaps - 20°, dry runways:

ECS	Engine Anti ice	Wing Anti ice	Figures
OFF	OFF	OFF	Fig 5-54 through Fig 5-68
ON	OFF	OFF	Fig 5-69 through Fig 5-83
ON	ON	ON or OFF	Fig 5-86 through Fig 5-100

For wet runways (with both thrust reversers operative at dispatch):

ECS	Engine Anti ice	Wing Anti ice	Figures
OFF	OFF	OFF	Fig 5-107 through Fig 5-121
ON	OFF	OFF	Fig 5-122 through Fig 5-136
ON	ON	ON or OFF	Fig 5-137 through Fig 5-151

For flaps - 10°, dry runways:

ECS	Engine Anti ice	Wing Anti ice	Figures
OFF	OFF	OFF	Fig 5-160 through Fig 5-174
ON	OFF	OFF	Fig 5-175 through Fig 5-189
ON	ON	ON	Fig 5-190 through Fig 5-204

For wet runways:

ECS	Engine Anti ice	Wing Anti ice	Figures
OFF	OFF	OFF	Fig 5-213 through Fig 5-227
ON	OFF	OFF	Fig 5-228 through Fig 5-242
ON	ON	ON	Fig 5-243 through Fig 5-257

The following figures are used to determine V_1, and takeoff field length corrections for wind and runway slope:
For dry runways, use Figure 5-84 for V_1 correction and Figure 5-85 for takeoff field length correction.
For wet runways, use Figure 5-152 V_1 correction and Figure 5-153 for takeoff field length correction (corrections for the number of thrust reversers available at dispatch is also included).

NOTE

1. The wet runway takeoff field length cannot be smaller than the dry runway takeoff field length for the same conditions. If the wet runway takeoff field length is smaller than the dry runway field length, use the dry runway field length.

2. For negative pressure altitudes:
   - Add 1 kt to V_1 at Sea Level for each 1000 ft below Sea Level;
   - If V_R is less than the corrected V1 use $V_R=V_1$;
   - For V_2, TOFL and GR2 use Sea Level data.

Definition Of Takeoff Data Example

Define the maximum allowable takeoff weight and takeoff speeds for the following conditions:
Flaps - 20°
Airport pressure altitude: 12,000 ft
Ambient temperature: 0°C
Engine bleeds: OFF
Wind: 10 knots (headwind)
Runway condition: Dry
Runway slope: minus (-)1% (downhill)
Available takeoff field length: 8000 ft

1. From Figure 5-48 determine the maximum allowable takeoff weight as permitted by climb gradient: 38,500 lb
2. From Figure Figure 5-53 determine the maximum allowable takeoff weight as permitted by tire speed limitations, corrected for 10 kt headwind: 40,400 lb
3. From Figure Figure 5-52 determine the maximum allowable takeoff weight as permitted by braking energy, corrected for 1% downhill runway slope and 10 kt headwind: 39,200 lb
4. Between the first three limitations limitation 1 is most restrictive.
5. From Figure 5-65 for takeoff weight found in step 4 determine the uncorrected required field length: 10910 ft.
6. From Figure 5-99 for takeoff weight found in step 4 and uncorrected TOFL found in step 5 determine the required field length corrected for runway slope and headwind: 9,910 ft.
   If this required length is greater than the available Takeoff field length, Takeoff with weight of 38,500 lb can not be accomplished from the available runway, and the takeoff weight must be reduced.
7. Repeat steps 5 and 6 in an iterative manner until required takeoff field length will be equal to available for the defined conditions.
   The corresponding takeoff weight is 35,860 lb.

V_1 = 130 kt
V_R = 134 kt
V_2 = 140 kt

HORIZONTAL STABILIZER TRIM SETTING FOR TAKEOFF

Horizontal stabilizer trim setting for takeoff is defined for each of the flaps settings as a function of the aircraft zero-fuel longitudinal center of gravity location, fuel quantity and field pressure altitude:

1. Figure 5-45 (for flaps - 20°)
2. Figure 5-46 (for flaps - 10°).

TAKEOFF PROCEDURES

Takeoff data is based on a non-rolling takeoff. The following takeoff procedure was assumed for the determination of takeoff performance data and should be used in actual takeoffs:

1. Before takeoff:
   - Check flaps, horizontal stabilizer trim and engine thrust settings.
   - Verify takeoff speeds and that APR and ground spoilers are not inhibited.
2. Line up on runway.
3. Apply wheel brakes to prevent aircraft movement.
4. Advance power and engage autothrottles if desired, or manually set thrust levers to T/O position. Monitor takeoff N1 before brake release. N1 will change during takeoff run but no correction is required after setting Thrust Levers to T/O position.
5. When takeoff thrust has been established, release brakes.

Normal Takeoff:

1. During a normal takeoff (all engines operating), rotate the airplane at V_R with an average rate of 3 to 4 degrees per second to an initial pitch attitude of 13 to 15 degrees (may vary according to gross weight, field elevation and ambient temperature). Adjust the pitch attitude to obtain the desired climb out speed and flight path, but limit pitch attitude to 25º maximum.
2. Retract landing gear when positive rate of climb is established.
3. Retract flaps no lower than 400 ft above runway and no slower than 10 knots below V_{SE} (V_{SE} -10 kt) as aircraft accelerates.

Rejected Takeoff:

1. If engine failure is recognized or if takeoff is aborted for other reasons before attaining V_1, retard power levers to idle. If RTO is armed the autobrake system will automatically apply maximum wheel braking. Maximum manual braking may be used if needed. Use thrust reversers and nose-wheel steering as required to stop the aircraft on the remaining runway.

(Continued)

NOTE

Credit for thrust reverser use in accelerate-stop distance for an aborted takeoff is taken on wet and contaminated runways and is not taken on dry runway.

Engine Failure After V1 (Continued Takeoff):

1. If engine failure occurs after V_1 but prior to V_R, continue acceleration to V_R, then rotate the airplane with an average rate of 3 to 4 degrees per second to an initial pitch attitude of 9 to 11 degrees (may vary according to gross weight, field elevation and ambient temperature.)
2. Verify that APR is ON. If APR is not ON, ensure operating engine thrust lever is pushed to the forward limit of travel and press the APR pushbutton.
3. Initiate gear retraction immediately when positive rate of climb is reached.
4. Adjust the airplane's pitch attitude to maintain V_2 to a height required for obstacle clearance (level-off height).
   - If engine failure occurs after V_2 but less than V_2 + 10 kt, maintain airspeed reached at time of engine failure.
   - If engine failure occurs at V_2 + 10 kt or higher, increase pitch to reduce airspeed. Maintain V_2 + 10 kt.

NOTE

The Flight Director is designed to command the pitch attitude that is required in order to achieve the target airspeeds that were described in this procedure.

5. Upon reaching a safe level-off height (as determined in this chapter), reduce pitch to maintain altitude while allowing the aircraft to accelerate with operating engine in APR mode.
6. Initiate flap retraction when aircraft accelerates through V2+15 kt.
7. Set maximum continuous thrust on operating engine.
8. Resume climb when aircraft reaches V_{SE}.

(Continued)

9. Climb at V_{SE} to desired altitude.
10. Perform ENGINE FAILURE DURING TAKEOFF ABOVE V1 checklist when clear of obstacles as workload permits.

CAUTION

APR operation longer than 9 minutes, 45 seconds with an engine failed will cause the Engine Exceedance caution message to come on.

<<END>>

TAKEOFF FLIGHT PATH (ONE ENGINE INOPERATIVE)

The takeoff flight path is divided into segments defined by changes in the airplane configuration. The terms used in flight path plotting are illustrated in Figure 5-2 and Figure 5-3. Different takeoff profiles are required according to the gross level-off height above the runway. If the gross level-off height is lower than 1,500 feet, then a final segment climb is required.

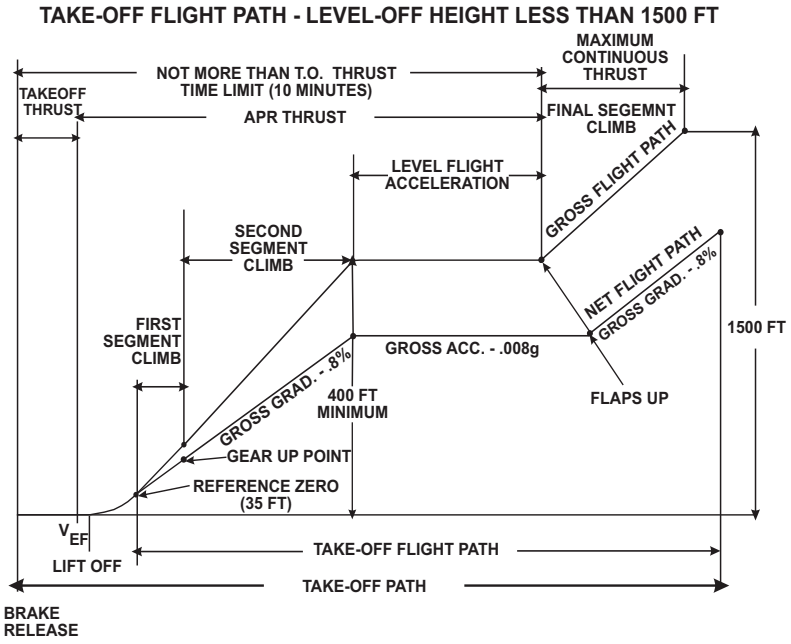

Figure 5-2. Takeoff Flight path (Level-off <1,500 ft)

(Continued)

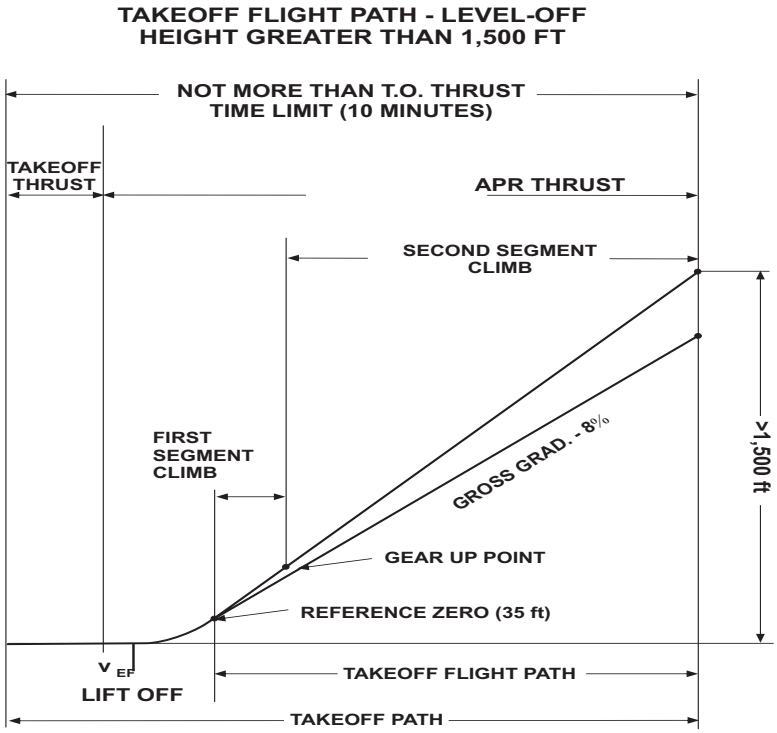

Figure 5-3. Takeoff Flight path (Level-off > 1,500 ft)

Reference Zero is the point along the runway where the aircraft attains a height of 35 ft for dry runway operations or 15 ft for wet runway operations.

The gross flight path represents the actual climb and acceleration performance of the airplane. The net flight path is obtained by reducing the gross climb performance by a climb gradient of 0.8% and by reducing the gross acceleration, during the level flight acceleration segment, by 0.008g. The net takeoff flight path must clear all obstacles by a minimum of 35 ft.

(Continued)

Use of the obstacle clearance data in this section will ensure that obstacles will be cleared by a minimum of 35 ft for dry runway takeoff. For wet runway takeoff, 20 ft must be added to heights read from the charts to assure 35 feet minimum clearance.

The takeoff flight path is divided into the following segments defined by changes in the airplane configuration:

1. First Segment extends from the 35 ft height at the end of the takeoff distance to the height at the end of gear retraction. It is flown at V2 speed with the operating engine at APR thrust.
2. Second segment begins at the end of gear retraction (end of first segment) and continues to level-off height at V_2 speed. The airplane is in takeoff flaps configuration, gear UP, and the operating engine is at APR thrust.
3. Transition segment (level flight acceleration) begins at the end of second segment and represents the acceleration at level-off height. It includes the acceleration from V_2 to flaps retraction speed, flaps retraction, and continued acceleration to final segment / enroute climb speed V_{SE}. The operating engine is at APR thrust during this segment.
4. Final Segment begins at the end of the transition segment and ends at 1500 ft above the runway. Final segment climb is based on gear - up, flaps - up, operating engine at maximum continuous thrust and V_{SE}.

The gross level-off height is selected before takeoff. It must not be less than 400 ft above airport elevation and not greater than the maximum gross level-off height. The maximum gross level-off height is attained when the takeoff thrust time limit (10 minutes) expires at the end of the acceleration segment (see Figure 5-2 and Figure 5-3). In addition, the pressure altitude corresponding to the gross level-off height must not exceed 20,000 ft, which is the maximum altitude for flight with flaps extended.

(Continued)

Takeoff Path Charts

The performance charts data in this section include the following information:

1. Available second segment gross climb gradients.
   a. Uncorrected values (GR2) at 400 ft above the runway are provided in the Takeoff tables for flaps settings 20° and 10°, runway condition dry and wet, and for engine bleed settings:
      ECS-OFF, EAI-OFF, WAI-OFF
      ECS-ON, EAI-OFF, WAI-OFF
      ECS-ON, EAI-ON, WAI-OFF or ON.
   b. Wind component correction charts for flaps settings 20° and 10°, see Figure 5-263 and Figure 5-264.
   c. Gross second segment climb gradient correction for level-off higher than 1,500 ft above airport elevation, see Figure 5-265 (same for both takeoff flap settings).
2. Required gross climb gradients for close-in and distant obstacle, see Figure 5-260 and Figure 5-261 respectively (same for both takeoff flaps settings).
3. Conversion from geometric height to pressure altitude increment, see Figure 5-262.
4. Horizontal acceleration distances of transition segment, see Figure 5-267.
5. Final segment gross climb gradient and corresponding speed, V_{SE}, see Figure 5-269.
6. Chart for determination of the pressure altitude for initiation of V2 increase for level-off height greater than 1,500 above airport elevation, Figure 5-266. (See further explanations on V2 below.)

(Continued)

Determination of Takeoff Flight Path for Obstacle Clearance

When flight path planning for obstacle clearance is desired, the following procedure may be used:

1. From the applicable takeoff weight limits charts, determine the highest takeoff weight as permitted by other limitations (takeoff field length, climb gradient, tire speed and brake energy). This weight is the first trial takeoff gross weight for obstacle clearance analysis.
2. Determine the horizontal distance of the obstacle from reference zero and obstacle height above airport elevation.
3. From the applicable takeoff flight path chart, depending on where the critical obstacle is located (close or distant obstacle), determine the required reference gross climb gradient for obstacle clearance.
   The gross level-off height is also determined at this stage. For most obstacle clearance cases, best performance is obtained by selecting a gross level-off height that ensures that all obstacles are cleared during the first or second segments.
4. From the Takeoff tables, determine the aircraft gross climb gradient available at 400 ft above the runway (GR2).

   To obtain the actual available climb gradient apply following corrections:
   a. Correction for wind (Headwind increases the available gradient, while tailwind decreases) Figure 5-263 and Figure 5-264.

(Continued)

b. Correction for gross level-off height:
This correction accounts for climb gradient reduction with pressure altitude between the point at 400 ft above the airport elevation and the level-off altitude. Different methods are used for determination of this correction depending on the level-off height.
For Level-off height less than 1,500 ft above airport elevation;
For each 500 ft level-off height above 400 ft reduce the reference gross climb gradient by 0.1%.
For Level-off height greater than 1,500 ft above airport elevation;
Use the Gross second segment climb gradient correction chart (Figure 5-265).

NOTE

The reference climb gradient obtained from the chart in Figure 5-265 represents an averaged gross second segment climb gradient. The actual gross climb gradient decreases with altitude, and at the level-off altitude it will be less than the reference gradient. To assure that the actual climb gradient during the entire second segment will always be above the 2.4% limit required by regulations, the reference climb gradient should be above the limiting line presented in the chart.

(Continued)

5.
   a. If the Reference climb gradient performance is more than the reference required climb gradient, obstacle clearance is satisfactory.
   b. If the Reference climb gradient performance is less than the Reference required climb gradient, obstacle clearance is unsatisfactory and procedures must be repeated using a lower weight.

When weight is reduced to achieve obstacle clearance, note that the horizontal distance between the obstacle and reference zero increases, since the takeoff field length is less. Consequently, an iterative process is required to find the exact minimum gradient and maximum weight for obstacle clearance.

NOTE

For non-standard temperature conditions, the indicated altitude when obstacle clearance has been achieved may be determined from Figure 5-262.

When Level-off height is less than 1,500 ft above airport elevation:

6. From Figure 5-267 determine the distance required to accelerate from V_2 to final segment climb speed.
   This distance is added to that determined at the end of second segment. The takeoff final speeds (V_{SE}) are presented in the takeoff distances tables as a function of takeoff gross weight and takeoff pressure altitude.
7. From Figure 5-269 determine the gross final segment climb gradient using correction for wind component and the appropriate engine bleed configuration. Calculated the gross final segment climb gradient as an average of the gradient at the start and at the end of the final segment.

(Continued)

Second Segment Climb Speed

Certification regulations require that the takeoff safety speed V2 must provide certain margins from the stall speed (1.13VSR) and from the stall warning (ability to perform a 30-deg bank maneuver free of stall warning). The V2 speeds presented in the takeoff tables provide these margins up to pressure altitude of at least 1,500 ft above the runway elevation. If second segment climb is extended to higher altitudes while maintaining the initial V2 the stall speed and maneuver margins can decrease below the required levels. Therefore increase of the climb speed with altitude may be required.

NOTE

Gradual increase of airspeed command during climb is possible only when MAN SPEED is selected for takeoff and increased manually during the climb. AUTO SPEED mode does not support extended second segment operation.

Chart for determination of the pressure altitude for initiation of V2 increase is presented in Figure 5-266. Starting from this altitude, speed should be gradually increased during climb by 2 KCAS per each 1,000 ft pressure altitude up to the level-off altitude.

The following procedure should be used for definition of the required V2 schedule for level-off height greater than 1,500 ft above airport elevation:

1. From takeoff tables determine initial V2 for the corresponding takeoff conditions (takeoff weight, flap configuration, airport elevation, ambient temperature, engine bleed configuration).
2. Determine pressure altitude at which V2 should be increased as the greater between the two following values:
   - Pressure altitude found from figure 5-266, and
   - 1,500 ft above the airport elevation

   For convenience, the found pressure altitude can be rounded to the closest 500 ft.

(Continued)

3. The resulting V_2 schedule is then determined as follows.
   - The initial V_2 is maintained up to the altitude found at step 2.
   - Starting from this altitude, V_2 should be gradually increased with pressure altitude by 2 knots per 1,000 ft up to level-off altitude.

NOTE

If level-off pressure altitude is lower than the pressure altitude for V_2 increase initiation, than V_2 should be kept constant during second segment climb.

(Continued)

Takeoff flight Path Examples

Example 1 – Level-off height less than 1,500 ft AGL

Determine whether the given obstacle is cleared and define the takeoff flight path up to 1500 ft above the runway

Given:
Airport ambient temperature - 37°C (ISA+26°C)
Airport Pressure Altitude - 2000 ft
Flaps - 20°
Takeoff gross weight - 32,000 lb
Headwind - 10 kt
ECS bleed - on
Engine and Wing Anti-ice - off
Obstacle height above departure end of runway. - 630 ft
Distance from reference zero - 16,000 ft.

Solution:

1. Locate the obstacle on Figure 5-261 with horizontal distance from reference zero = 16,000 ft and obstacle height above the takeoff surface = 630 ft. Determine the obstacle clearance reference gross climb gradient required to be 5.3%, and the minimum level-off height of 800 ft AGL.
2. Enter Takeoff tables with Flaps 20°, airport pressure altitude of 2,000 ft, engine bleed setting of ECS ON EAI and WAI OFF, and dry runway (Figure 5-71).
   For airport ambient temperature of 37°C and takeoff weight of 32,000 lb read GR2 value of 7.2% and V2 of 122 KCAS.
3. Introduce the following corrections:
   a. +0.3% - for the 10 kt head wind
   b. -0.08% - for higher than 400 ft gross level-off altitude:
      0.1*(800-400)/500 = 0.08%

   The resulting available reference gross second segment climb gradient is: 7.2%+0.3%-0.08% =7.42%

(Continued)

4. Since the available gross climb gradient (7.42%) is greater than the required gross climb gradient (5.3%), obstacle clearance is satisfactory.
5. For a gross level-off height of 800 ft at ISA + 26°C, the pressure height of 730 ft above the airport is obtained from Figure 5-262.

   Since the airport pressure altitude is 2,000 ft, the level-off pressure altitude is: 2,000 ft + 730 ft = 2,730 ft
6. Assuming gross climb gradient of 7.42%, Figure 5-261 can be used to determine the second segment distance at level-off height of 800 ft. In this case it is 11,000 ft.
7. From Figure 5-267 with the level-off pressure altitude (2,730 ft), determine the net acceleration distance. In this case it is 13,500 ft.
8. Since the gross level-off height is less than 1,500 ft, a final segment is required. The final segment gross climb gradient is determined as follows:
   a. Using Figure 5-269 with ECS on and 10 kt headwind corrections determine final segment gross climb gradient at the pressure altitude of the level-off height (2,730 ft) – 7.5%.
   b. Using correction chart of Figure 5-262 for a gross height of 1,500 ft, the pressure height above the airport is found to be 1,400 ft for an ISA + 26°C day, which gives the overall pressure altitude at this point of 3,400 ft
   c. Using Figure 5-269 determine final segment gross climb gradient at the pressure altitude of 3,400 ft is 7.2%
   d. Determine average gross climb gradient between the level-off and final altitudes: (7.5+7.2)/2 = 7.35%
   e. The final segment distance is calculated as follows:
      Final Segment Distance = (delta gross height / average gross climb gradient) = (1,500 - 800) / 7.35% = 9,524 ~9,530 ft
9. The total distance from reference zero becomes:
   11,000 ft + 13,500 ft + 9,530 ft = 34,030 ft (distance to level-off height + transition + final segment)
10. Since the level-off height is below 1,500 ft, constant V_2 of 122 KCAS should be maintained up to level-off altitude.

Example 2 – Level-off height greater than 1,500 ft AGL, with no V2 increase required during climb

Determine whether the given obstacle is cleared and find the associated level-off altitude and V_2 speed at level-off height.

Given:
Airport ambient temperature -13°C (ISA -20°C)
Airport Pressure Altitude – 4,000 ft
Flaps - 20°
Takeoff gross weight - 33,000 lb
Engine bleed: ECS ON, EAI ON and WAI ON
Tailwind -10 kt
Obstacle height above the takeoff surface – 3,000 ft
Distance from reference zero - 72,000 ft

Solution:

1. Locate the obstacle on Figure 5-261 with horizontal distance from reference zero = 72,000 ft and obstacle height above the takeoff surface = 3,000 ft. Determine the obstacle clearance gross climb gradient required to be 5.0%, and the minimum level-off height of 3,600 ft AGL.
2. Enter Takeoff tables with Flaps 20°, airport pressure altitude of 3,000 ft, engine bleed setting of ECS ON EAI ON and WAI ON, and dry runway (Figure 5-89).

   For airport ambient temperature of -13°C and takeoff weight of 33,000 lb read GR2 value of 7.6%, and V2 speed of 124 KCAS.
3. Introduce climb gradient correction for wind component (Figure 5-263): -0.8% for the -10 kt tailwind.
   The resulting wind corrected available gross second segment climb gradient is: 7.6% - 0.8%=6.8%
4. Determine the Reference available 2nd segment climb gradient to level-off height of 3,600 ft AGL using Figure 5-265, as 5.8%.
5. Since the available gross climb gradient (5.8%) is greater than the required gross climb gradient (5.0%), obstacle clearance is satisfactory.

(Continued)

6. For a gross level-off height of 3,600 ft at ISA -20°C, the pressure height of 3,900 ft above the airport is obtained from Figure 5-261.

   Since the airport pressure altitude is 3,000 ft, the level-off pressure altitude is: 3,000 ft + 3,900 ft = 6,900 ft.

7. Determine pressure altitude at which V_2 is required to be gradually increased, as the greater between:
   - 4,000 + 1,500 = 5,500 ft, and
   - 8,500 ft as found for Flaps 20° and GWT of 33,000 lb using Figure 5-265.

   The resulting altitude is 8,500 ft.

   Since the found pressure altitude at which V_2 is required to be gradually increased (8,500 ft) is greater than the level-off pressure altitude (6,900 ft), constant V_2 of 124 KCAS is maintained during climb.

Example 3 – Level-off height greater than 1,500 ft AGL with V2 increase during climb

Determine whether the given obstacle is cleared and find the associated level-off altitude and V_2 speed up to level-off height.

Given:
Airport ambient temperature -25°C (ISA -20°C)
Airport Pressure Altitude – 6,000 ft
Wet Runway
Flaps - 10°
Takeoff gross weight - 35,000 lb
Engine bleed: ECS OFF, EAI and WAI OFF
Headwind +20 kt
Obstacle height above the takeoff surface – 3,280 ft
Distance from reference zero - 81,000 ft

Solution:

1. Locate the obstacle on Figure 5-261 with horizontal distance from reference zero = 81,000 ft and obstacle height above the takeoff surface = 3,300 ft (3,280 ft +20 ft for wet runway height above reference zero correction). Determine the obstacle clearance gross climb gradient required to be 5.0%, and the minimum level-off height of 4,000 ft AGL.
2. Enter Takeoff tables with Flaps 10°, airport pressure altitude of 6,000 ft, engine bleed setting of ECS OFF EAI OFF and WAI OFF, and wet runway (Figure 5-219).

   For airport ambient temperature of -25°C and takeoff weight of 35,000 lb read GR2 value of 7.4%, and V_2 speed of 139 KCAS.

   Correct climb gradient for wind component (Figure 5-264): +0.3% for the +20 kt headwind. The resulting wind corrected available gross second segment climb gradient is: 7.4% + 0.3%=7.7%.

(Continued)

3. Determine the Reference available 2nd segment climb gradient to level-off height of 4,000 ft AGL using Figure 5-265, as 6.5%
4. Since the Reference available gross climb gradient (6.5%) is greater than the Reference required gross climb gradient (5.0%), obstacle clearance is satisfactory.
5. For a gross level-off height of 4,000 ft at ISA -20°C, the pressure altitude of 4,300 ft above the airport elevation is obtained from Figure 5-262.

   Since the airport pressure altitude is 6,000 ft, the level-off pressure altitude is: 6,000 ft + 4,300 ft = 10,300 ft
6. Determine V_2 increase initiation pressure altitude:
   a. Using Figure 5-266 for Flaps 10° and GWT of 35,000 lb, determine pressure altitude at which V_2 is required to be gradually increased as 5,000 ft.
   b. Calculate pressure altitude at a height of 1,500 ft above the airport elevation: 6,000 + 1,500 = 7,500 ft
   c. The resultant V2 increase initiation pressure altitude is 7,500 ft - the greater between a) and b)

      V2 climb speed increment to level-off altitude is:
      (10,300-7,500)*2/1000=5.6 KCAS ~ 6 KCAS

      The following climb speed profile should be followed:
      139 KCAS 7,500 ft MSL
      141 KCAS between 7,500 and 8,500 ft MSL
      143 KCAS between 8,500 and 9,500 ft MSL
      145 KCAS between 9,500 and 10,300 ft MSL (level-off altitude)

ENROUTE CLIMB

Charts are presented for choosing the enroute climb speed (V_{SE}) and for determining the net enroute climb gradient (Figure 5-270 and Figure 5-271 respectively).

The enroute climb speeds were established as 1.23 V_{SR} to provide adequate maneuver margins, and are effective for all engine bleed configurations. The gradient data shown have been reduced by a gradient of 1.1% as specified by CFR 14, Part 25. The gradient of climb read from the chart should be used directly.

NOTE

During and following prolonged flight in icing conditions, when ice accretions are suspected on unprotected surfaces, decrease the enroute climb gradient by 1.1%.

Conditions for enroute climb:

1. Landing Gear retracted
2. Flaps - 0°
3. Critical engine inoperative
4. Operating engine at Maximum Continuous Thrust
5. ECS bleed - on (ECS off not applicable for enroute climb)

Example: Find the enroute climb speed and the resulting gradient.

Given:
Ambient temperature: 5°C
Gross weight: 35,000 lb
Pressure altitude: 25,000 ft
Engine and wing anti-ice: on
Tailwind: 10 kt

Solution:

1. Enter Figure 5-270 with the pressure altitude of 25,000 ft. Proceed right to 35,000 lb, then read down to a climb speed of 189 KCAS.
2. Enter Figure 5-271 with the temperature of 5°C. Proceed up to 15,000 ft, right to 35,000 lb, then continue with anti-ice bleed and wind corrections, to read a Net Gradient of 1.3%.

BUFFET BOUNDARY

Buffet boundary data are presented as a function of speed, weight and load factor in Figure 5-47.
For speeds below approximately 0.75 Mach, the buffet boundary is based on shaker onset (low speed buffet) while natural buffet (high speed buffet) is limiting above this speed.

Example: determine the load factor at the defined flight conditions

Given:
Mach No: 0.75
Altitude: 37,000 ft.
Gross weight: 30,000 lb.

Solution:
Under the above conditions, buffet can be expected at 2.0 g load factor

APPROACH AND LANDING PERFORMANCE

APPROACH CLIMB GRADIENTS (ONE ENGINE INOPERATIVE)

Figure 5-272 presents the approach climb gradients as a function of the gross weight, pressure altitude and ambient temperature. Corrections for wind component and anti-ice condition are also provided. The presented gradients are achieved at the recommended final approach speed VAPP which is equal to V_{REF} + 5 kt (where V_{REF} is the threshold speed) and is presented in the landing charts of Figure 5-278).

The approach climb gradient may not be less than 2.1%.

Conditions for approach climb:
1. Landing gear retracted
2. Flaps - 20°
3. Critical engine inoperative
4. Operating engine at Takeoff Thrust
5. Bank angle not to exceed 5°
6. ECS bleeds - on (ECS off not applicable for approach Climb)

NOTE

During and following prolonged flight in icing conditions, when ice accretions are suspected on unprotected surfaces, decrease climb gradient by 0.7%.

LANDING CLIMB GRADIENTS (BOTH ENGINES OPERATIVE)

Figure 5-272 presents the landing climb gradients as a function of the gross weight, pressure altitude and ambient temperature. Corrections for wind component and anti-ice condition are also provided. The presented gradients are achieved at V_{REF} which is presented in the landing charts of Figure 5-278.The landing climb gradient may not be less than 3.2%.

Conditions for landing climb:

1. Landing gear extended
2. Flaps - 39°
3. Both engine at thrust available eight (8) seconds after movement of the thrust levers from high idle to go-around position
4. ECS bleed - on (ECS off not applicable for all engine landing climb)

NOTE

During and following prolonged flight in icing conditions, when ice accretions are suspected on unprotected surfaces, decrease landing climb gradient by 0.7%.

FINAL APPROACH AND LANDING PERFORMANCE

This section includes information for landing in normal and abnormal landing conditions.

NORMAL LANDING CONDITIONS

Normal landings are performed with flaps 39° setting and must be made within the limitations of the allowable landing weight as defined below.

EYE-TO-WHEEL HEIGHT

Maximum Eye-to-Wheel Height with unloaded main landing gear in the landing altitude relative to the ground (6° Nose Up) is 12.6 feet (3.83 meters).

Maximum allowable landing weight

The maximum allowable landing weight is limited by the most restrictive of the following:

1. The maximum approved landing weight (design structural limit for landing) of 32700 lb.

NOTE

Landing above the established maximum structural landing weight is permitted for immediate return landing conditions only.

(Continued)

2. The maximum landing weight limited by climb requirements for varying conditions of airport pressure altitude and temperature, see Figures 5-273, 5-274 and 5-275.

3. The maximum landing weight as permitted by the landing braking energy limitation, see Figure 5-276

NOTE

1. Normal landings are restricted by the braking energy not exceeding the blow-out plug energy limit of 29.7 MFP plus braking energy required for quick turn-around procedures as defined by regulations.

2. During immediate return landings, braking energy may exceed the blow-out plug energy and is no longer a limiting factor for maximum allowable landing weight. However, after the stop, wheel fuse plugs may release and brake and tire damage will occur.

4. The maximum landing weight as restricted by the tire speed limitation, see Figure 5-277.

APPROACH AND LANDING SPEEDS

The threshold speed (V_{REF}) for landing distance is based on 1.23 V_{SR} in the landing configuration (flaps 39°). Final approach speeds V_{APP} are computed as the landing threshold speed plus appropriate speed margins. The final approach speed margin must not be greater than that which can be bled off before the point of crossing the runway threshold. A final approach speed margin of 5 KCAS is recommended but not mandatory.

The approach and landing speeds are presented in a tabulated form in Figure 5-278 together with the corresponding landing distance. These speeds are effective throughout the certified weight, temperature and altitude range of the aircraft.

NOTE

When winds are greater than 10 knots or wind gusts are reported, add half the steady headwind component plus full gust value up to a maximum of 20 kt to V_{REF}.
Landing distance calculations are based on crossing the threshold at V_{REF}. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10-knot overspeed.

CAUTION

TIRE SPEED LIMITATIONS WILL BE EXCEEDED IF TOUCHDOWN IS MADE IN EXCESS OF 195 KT GROUND SPEED OR IF NOSE WHEEL IS LOWERED IN EXCESS OF 182 KT GROUND SPEED.

(Continued)

ACTUAL LANDING DISTANCE

Landing distance represents the horizontal distance required to land and to come to a complete stop from a point at a height of 50 ft above the runway surface.

Figure 5-278 presents the actual landing distances (ALD) for normal flaps setting (39°) as a function of landing gross weight and airport pressure altitude. Corrections for wind components are provided in Figure 5-279.

Landing distance is based on the following conditions:

1. Smooth, level, dry and hard-surfaced runway surface.
2. A 3° glide path at 50 ft and on a steady sink rate of 6 fps at touchdown.

NOTE

1. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10-knot overspeed.
2. The actual landing distance presented is based on ISA temperature and zero runway slope conditions. Corrections are provided for reported wind conditions and possible speed increase to the threshold speed V_{REF}.

Applicable regulations do not require actual landing distance to be corrected for temperature and runway slope effects. If required, the operator may use the following ALD temperature and runway slope corrections:

ALD Temperature Corrections:

Increase dry ALD by 3% for every 10°C above ISA.
Decrease dry ALD by 2% for every 10°C below ISA.

ALD Runway Slope Corrections:

Increase dry ALD by 16% for every 1% DOWNHILL runway slope.
Decrease dry ALD by 5% for every 1% UPHILL runway slope.

Landing Procedure:

1. Establish V_{REF} by 50 ft above the runway surface with thrust necessary to maintain 3° flight path.
2. At 50 ft reduce thrust of both engines to idle.
3. Perform moderate flare at approximately 20 ft above the runway surface to reduce the sink rate to approximately 6 fps.
4. Immediately after touchdown, the nose is lowered and full brakes applied. Auto ground spoilers are extended at main gear touchdown by wheel speed spin-up.
5. Deploy thrust reversers as required. Note that reverse thrust credit is not shown in the landing distance charts, but the use of thrust reverse will result in a shorter distance and will improve brakes wear.

(Continued)

Example: determine the maximum allowable landing weight for the defined conditions and determine landing distance for this weight.

Given:
Airport Pressure Altitude: 7000 ft
Airport Ambient Temperature: 31°C
Runway Slope: -1% (downhill)
Tailwind: 10 kt
Solution:
Maximum allowable landing weight:

1. BKE limited landing weight: 32,000 lb
2. Tire speed limited landing weight: 39400 lb
3. Maximum structural landing weight (MLW): 32,700 lb

The resulting maximum allowable landing weight is 32,000 lb
Landing Distance:

1. From Figure 5-278 determine the actual uncorrected landing distance to be 3560 ft
2. From Figure 5-279 determine the landing distance corrected for the reported wind to be 3800 ft.
3. For 10°C (ISA+20°C) the temperature correction is 3*(20/10) = +6.0%
4. For 1% downhill slope the correction is 16%
5. The resulting actual landing distance is 3800 * 1.060 * 1.16 = 4670 ft
6. Determine the factored landing distance for intended or alternate destination:

Dry runway: 4670 /0.6 = 7780 ft
Wet runway: 1.15 * 7780 = 8950 ft

LANDING DISTANCE USING AUTOBRAKES

The autobrakes system provides selection of three levels of deceleration: LOW, MED and HIGH. Use of the autobrakes system is optional. The pilot selects an autobrake setting which ensures that the aircraft will stop safely within the available runway length. The use of reverse thrust allows the autobrakes system to reduce the brake pressure to the minimum level associated with the selected deceleration level, thus, minimizing brake and tire wear and keeping the brake temperature to a minimum level. Normal pilot braking can be resumed at any time during the landing roll, by brake pedal application.

The following data presents the actual distance from touchdown to full stop, with the autobrake system in use during normal landing and is provided as guidance information. This performance information is based on a threshold speed of V_{REF}.

Tables presented in Figure 5-280 (HIGH), Figure 5-282 (MED) and Figure 5-284 (LOW) provide for each of the autobrake setting the following information as a function of the landing gross weight and airport pressure altitude at ISA, zero-wind conditions:

- Recommended approach speed - V_{APP}
- Threshold speed - V_{REF}
- Air distance from a point at a height of 50 ft above the runway surface to touchdown
- Actual landing ground roll landing distance from touchdown to full stop as a function of the landing gross weight and airport pressure altitude, for ISA, zero-wind conditions.
- Actual landing distance (a sum of the air and ground roll distances)
- For determination of wind correction of the actual landing distance for each of the autobrake settings use Figure 5-281 (HIGH), Figure 5-283 (MED) and Figure 5-285 (LOW).

(Continued)

NOTE

1. HIGH autobrakes setting does not correspond to maximum braking.
2. Any of the autobrake settings can be used on wet runways, however, the LOW setting distance information in Figure 5-284 must be used when determining the landing distance using autobrakes.

Example: determine the ground roll distance and actual landing distance with autobrakes for the defined conditions.

Given:
Landing weight: 32,000 lb
Airport pressure altitude: 7000 ft
Airport ambient temperature: ISA
Tailwind: 10 kt
Autobrakes = MED

Solution:
1. From Figure 5-282 determine the ground roll distance to be 4010 ft and the actual uncorrected landing distance to be 5180 ft
2. From Figure 5-283 determine the landing distance corrected for the reported wind to be 5,900 ft

ABNORMAL LANDING CONDITIONS

Landing with flaps settings other than normal landing setting of 39° is allowed only when the normal landing flaps setting is unavailable.

Maximum Allowable Landing Weight

The maximum allowable landing weight is limited by the most restrictive of the following:

1. The maximum approved landing weight (design structural limit for landing) of 32,700 lb.

NOTE

Landing weight above the established maximum structural landing weight is permitted for immediate return landing conditions only.

2. The maximum landing weight as permitted by the maximum brake energy limit, as a function of the airport pressure altitude and reported ambient temperature with correction for the reported wind and runway slope.
   Figure 5-288 for flaps 20°, Figure 5-292 for flaps 10°, Figure 5-296 for flaps 0°

NOTE

During landing in abnormal configurations, brake energy may exceed the wheel fuse plugs blow-out limit. After the stop, wheel fuse plugs may release and brakes and tires damage will occur.

3. The maximum landing weight as restricted by the tire speed limit as a function of the airport pressure altitude and reported ambient temperature with correction for the reported wind. Figure 5-287 for flaps 20°, Figure 5-291 for flaps 10°, Figure 5-295 for flaps 0°

NOTE

Maximum allowable landing weight in abnormal configurations is never restricted by climb gradient requirements.

Landing Speeds and Distances

Recommended final approach speed V_{APP}, threshold speed V_{REF} and corresponding actual landing distance as a function of the landing gross weight and airport pressure altitude at ISA, zero-wind conditions are presented in a tabulated form in Figure 5-289 for flaps 20°, Figure 5-293 for flaps 10°, Figure 5-297 for flaps 0°.

Correction for the reported wind:

Figure 5-290 for flaps 20°, Figure 5-294 for flaps 10°, Figure 5-298 for flaps 0°.

NOTE

1. For landings with V_{REF} above the scheduled value, add 12% to the actual landing distance per each 10-knot overspeed.
2. The actual landing distance is based on ISA temperature and zero runway slope conditions. Corrections are provided for reported wind conditions and possible speed increase to the threshold speed, V_{REF}. Applicable regulations do not require actual landing distance to be corrected for temperature and runway slope effects. If required, the operator may use the following ALD temperature and runway slope corrections: ALD temperature corrections:
   Increase dry ALD by 3% for every 10°C above ISA. Decrease dry ALD by 2% for every 10°C below ISA. ALD runway slope corrections:
   Increase dry ALD by 16% for every 1% downhill runway slope. Decrease dry ALD by 5% for every 1% uphill runway slope.

OPERATING RULES FOR COMMERCIAL OPERATORS

The following operating rule applies to all commercial operators, required to observe the regulations of CFR 14, Part 121 or Part 135:

1. Intended destination and alternate airports, dry runways: no airplane shall takeoff at weight in excess of that which, in accordance with landing distances shown in this AFM for the airport elevation and wind conditions anticipated there at the time of landing, would allow full stop landing within 60% of the effective length of the runway from a point 50 ft directly above the intersection of obstruction clearance plane and the runway.
2. Intended destination and alternate airports, wet runways: no airplane shall takeoff when appropriate weather reports and forecasts, or a combination thereof, indicate that runways may be wet or slippery at the estimated time of arrival unless effective wet runway length is at least 115% of the dry runway length. Note that wet runway distances are valid only for 0.125 in (3 mm) or less of standing water.

When operating under other than Part 121 or Part 135 rules, other operational factors may be required. If desired, Figure 5-286 provides a chart to convert the actual landing distance to a factored landing distance as a function of the applicable operational factor.
